2016-04-09

1	What is BorgBackup?	1
1.1	Main features	1
1.2	Easy to use	2
2	Links	3
2.1	Notes	3

What is BorgBackup?

BorgBackup (short: Borg) is a deduplicating backup program. Optionally, it supports compression and authenticated encryption.

The main goal of Borg is to provide an efficient and secure way to backup data. The data deduplication technique used makes Borg suitable for daily backups since only changes are stored. The authenticated encryption technique makes it suitable for backups to not fully trusted targets.

See the [installation manual](#) or, if you have already downloaded Borg, `docs/installation.rst` to get started with Borg.

1.1 Main features

Space efficient storage Deduplication based on content-defined chunking is used to reduce the number of bytes stored: each file is split into a number of variable length chunks and only chunks that have never been seen before are added to the repository.

To deduplicate, all the chunks in the same repository are considered, no matter whether they come from different machines, from previous backups, from the same backup or even from the same single file.

Compared to other deduplication approaches, this method does NOT depend on:

- file/directory names staying the same: So you can move your stuff around without killing the deduplication, even between machines sharing a repo.
- complete files or time stamps staying the same: If a big file changes a little, only a few new chunks need to be stored - this is great for VMs or raw disks.
- The absolute position of a data chunk inside a file: Stuff may get shifted and will still be found by the deduplication algorithm.

Speed

- performance critical code (chunking, compression, encryption) is implemented in C/Cython
- local caching of files/chunks index data
- quick detection of unmodified files

Data encryption All data can be protected using 256-bit AES encryption, data integrity and authenticity is verified using HMAC-SHA256. Data is encrypted clientside.

Compression All data can be compressed by lz4 (super fast, low compression), zlib (medium speed and compression) or lzma (low speed, high compression).

Off-site backups Borg can store data on any remote host accessible over SSH. If Borg is installed on the remote host, big performance gains can be achieved compared to using a network filesystem (sshfs, nfs, ...).

Backups mountable as filesystems Backup archives are mountable as userspace filesystems for easy interactive backup examination and restores (e.g. by using a regular file manager).

Easy installation on multiple platforms We offer single-file binaries that do not require installing anything - you can just run them on these platforms:

- Linux
- Mac OS X
- FreeBSD
- OpenBSD and NetBSD (no xattrs/ACLs support or binaries yet)
- Cygwin (not supported, no binaries yet)

Free and Open Source Software

- security and functionality can be audited independently
- licensed under the BSD (3-clause) license

1.2 Easy to use

Initialize a new backup repository and create a backup archive:

```
$ borg init /mnt/backup
$ borg create /mnt/backup::Saturday1 ~/Documents
```

Now doing another backup, just to show off the great deduplication:

```
$ borg create -v --stats /mnt/backup::Saturday2 ~/Documents
-----
Archive name: Saturday2
Archive fingerprint: 622b7c53c...
Time (start): Sat, 2016-02-27 14:48:13
Time (end):   Sat, 2016-02-27 14:48:14
Duration: 0.88 seconds
Number of files: 163
-----

```

	Original size	Compressed size	Deduplicated size	
This archive:	6.85 MB	6.85 MB	30.79 kB	<-- !
All archives:	13.69 MB	13.71 MB	6.88 MB	

```

```

	Unique chunks	Total chunks
Chunk index:	167	330

```
-----
```

For a graphical frontend refer to our complementary project [BorgWeb](#).

2.1 Notes

Borg is a fork of Attic and maintained by “The Borg collective”.

2.1.1 Differences between Attic and Borg

Here’s a (incomplete) list of some major changes:

- more open, faster paced development (see [issue #1](#))
- lots of attic issues fixed (see [issue #5](#))
- less chunk management overhead (less memory and disk usage for chunks index)
- faster remote cache resync (useful when backing up multiple machines into same repo)
- compression: no, lz4, zlib or lzma compression, adjustable compression levels
- repokey replaces problematic passphrase mode (you can’t change the passphrase nor the pbkdf2 iteration count in “passphrase” mode)
- simple sparse file support, great for virtual machine disk files
- can read special files (e.g. block devices) or from stdin, write to stdout
- mkdir-based locking is more compatible than attic’s posix locking
- uses fadvise to not spoil / blow up the fs cache

- better error messages / exception handling
- better logging, screen output, progress indication
- tested on misc. Linux systems, 32 and 64bit, FreeBSD, OpenBSD, NetBSD, Mac OS X

Please read the [ChangeLog](#) (or `docs/changes.rst` in the source distribution) for more information.

BORG IS NOT COMPATIBLE WITH ORIGINAL ATTIC (but there is a one-way conversion).

EXPECT THAT WE WILL BREAK COMPATIBILITY REPEATEDLY WHEN MAJOR RELEASE NUMBER CHANGES (like when going from 0.x.y to 1.0.0 or from 1.x.y to 2.0.0).

NOT RELEASED DEVELOPMENT VERSIONS HAVE UNKNOWN COMPATIBILITY PROPERTIES.

THIS IS SOFTWARE IN DEVELOPMENT, DECIDE YOURSELF WHETHER IT FITS YOUR NEEDS.

Borg is distributed under a 3-clause BSD license, see [License](#) for the complete license.

Installation

There are different ways to install Borg:

- *Distribution Package* - easy and fast if a package is available from your distribution.
- *Standalone Binary* - easy and fast, we provide a ready-to-use binary file that comes bundled with all dependencies.
- *From Source*, either:
 - *Using pip* - installing a source package with pip needs more installation steps and requires all dependencies with development headers and a compiler.
 - *Using git* - for developers and power users who want to have the latest code or use revision control (each release is tagged).

Distribution Package

Some distributions might offer a ready-to-use `borgbackup` package which can be installed with the package manager. As Borg is still a young project, such a package might be not available for your system yet.

Distribution	Source	Command
Arch Linux	[community]	<code>pacman -S borg</code>
Debian	<code>stretch, unstable/sid</code>	<code>apt install borgbackup</code>
NetBSD	<code>pkgsrc</code>	<code>pkg_add py-borgbackup</code>
NixOS	<code>.nix file</code>	N/A
OS X	Brew cask	<code>brew cask install borgbackup</code>
Ubuntu	Xenial 16.04, Wily 15.10 (backport PPA)	<code>apt install borgbackup</code>
Ubuntu	Trusty 14.04 (backport PPA)	<code>apt install borgbackup</code>

Please ask package maintainers to build a package or, if you can package / submit it yourself, please help us with that! See [#105](#) on github to followup on packaging efforts.

If a package is available, it might be interesting to check its version and compare that to our latest release and review the [Changelog](#).

Standalone Binary

Borg binaries (generated with `pyinstaller`) are available on the [releases](#) page for the following platforms:

- **Linux:** glibc \geq 2.13 (ok for most supported Linux releases). Maybe older glibc versions also work, if they are compatible to 2.13.
- **Mac OS X:** 10.10 (does not work with older OS X releases)
- **FreeBSD:** 10.2 (unknown whether it works for older releases)

To install such a binary, just drop it into a directory in your `PATH`, make borg readable and executable for its users and then you can run `borg`:

```
sudo cp borg-linux64 /usr/local/bin/borg
sudo chown root:root /usr/local/bin/borg
sudo chmod 755 /usr/local/bin/borg
```

Note that the binary uses `/tmp` to unpack Borg with all dependencies. It will fail if `/tmp` has not enough free space or is mounted with the `noexec` option. You can change the temporary directory by setting the `TEMP` environment variable before running Borg.

If a new version is released, you will have to manually download it and replace the old version using the same steps as shown above.

From Source

Dependencies To install Borg from a source package (including pip), you have to install the following dependencies first:

- **Python 3** \geq 3.4.0, plus development headers. Even though Python 3 is not the default Python version on most systems, it is usually available as an optional install.
- **OpenSSL** \geq 1.0.0, plus development headers.
- **libacl** (that pulls in **libattr** also), both plus development headers.
- **liblz4**, plus development headers.
- some Python dependencies, pip will automatically install them for you
- optionally, the **libfuse** Python package is required if you wish to mount an archive as a FUSE filesystem. See `setup.py` about the version requirements.

If you have troubles finding the right package names, have a look at the distribution specific sections below and also at the Vagrantfile in our repo.

In the following, the steps needed to install the dependencies are listed for a selection of platforms. If your distribution is not covered by these instructions, try to use your package manager to install the dependencies. On FreeBSD, you may need to get a recent enough OpenSSL version from FreeBSD ports.

After you have installed the dependencies, you can proceed with steps outlined under *Using pip*.

Debian / Ubuntu Install the dependencies with development headers:

```
sudo apt-get install python3 python3-dev python3-pip python-virtualenv \
libssl-dev openssl \
libacl1-dev libacl1 \
liblz4-dev liblz4-1 \
build-essential
sudo apt-get install libfuse-dev fuse pkg-config # optional, for FUSE support
```

In case you get complaints about permission denied on `/etc/fuse.conf`: on Ubuntu this means your user is not in the `fuse` group. Add yourself to that group, log out and log in again.

Fedora / Korora Install the dependencies with development headers:

```
sudo dnf install python3 python3-devel python3-pip python3-virtualenv
sudo dnf install openssl-devel openssl
sudo dnf install libacl-devel libacl
sudo dnf install lz4-devel
sudo dnf install gcc gcc-c++
sudo dnf install fuse-devel fuse pkgconfig          # optional, for FUSE support
```

Mac OS X Assuming you have installed `homebrew`, the following steps will install all the dependencies:

```
brew install python3 lz4 openssl
pip3 install virtualenv
```

For FUSE support to mount the backup archives, you need at least version 3.0 of FUSE for OS X, which is available as a [pre-release](#).

FreeBSD Listed below are packages you will need to install Borg, its dependencies, and commands to make fuse work for using the mount command.

```
pkg install -y python3 openssl liblz4 fusefs-libs pkgconf
pkg install -y git
python3.4 -m ensurepip # to install pip for Python3
To use the mount command:
echo 'fuse_load="YES"' >> /boot/loader.conf
echo 'vfs.usermount=1' >> /etc/sysctl.conf
kldload fuse
sysctl vfs.usermount=1
```

Cygwin

Note: Running under Cygwin is experimental and has only been tested with Cygwin (x86-64) v2.1.0.

Use the Cygwin installer to install the dependencies:

```
python3 python3-setuptools
python3-cython # not needed for releases
binutils gcc-g++
libopenssl openssl-devel
liblz4_1 liblz4-devel # from cygwinports.org
git make openssl
```

You can then install `pip` and `virtualenv`:

```
easy_install-3.4 pip
pip install virtualenv
```

In case the creation of the virtual environment fails, try deleting this file:

```
/usr/lib/python3.4/__pycache__/platform.cpython-34.pyc
```

Using pip `Virtualenv` can be used to build and install Borg without affecting the system Python or requiring root access. Using a virtual environment is optional, but recommended except for the most simple use cases.

Note: If you install into a virtual environment, you need to **activate** it first (`source borg-env/bin/activate`), before running `borg`. Alternatively, symlink `borg-env/bin/borg` into some directory that is in your `PATH` so you can just run `borg`.

This will use `pip` to install the latest release from PyPi:

```
virtualenv --python=python3 borg-env
source borg-env/bin/activate

# install Borg + Python dependencies into virtualenv
pip install borgbackup
# or alternatively (if you want FUSE support):
pip install borgbackup[fuse]
```

To upgrade Borg to a new version later, run the following after activating your virtual environment:

```
pip install -U borgbackup # or ... borgbackup[fuse]
```

Using git This uses latest, unreleased development code from git. While we try not to break master, there are no guarantees on anything.

```
# get borg from github
git clone https://github.com/borgbackup/borg.git

virtualenv --python=python3 borg-env
source borg-env/bin/activate # always before using!

# install borg + dependencies into virtualenv
pip install sphinx # optional, to build the docs
cd borg
pip install -r requirements.d/development.txt
pip install -r requirements.d/fuse.txt # optional, for FUSE support
pip install -e . # in-place editable mode

# optional: run all the tests, on all supported Python versions
# requires fakeroot, available through your package manager
fakeroot -u tox
```

Note: As a developer or power user, you always want to use a virtual environment.

Quick Start

This chapter will get you started with Borg. The first section presents a simple step by step example that uses Borg to backup data. The next section continues by showing how backups can be automated.

Important note about free space

Before you start creating backups, please make sure that there is **always** a good amount of free space on the filesystem that has your backup repository (and also on `~/cache`). It is hard to tell how much, maybe 1-5%.

If you run out of disk space, it can be hard or impossible to free space, because Borg needs free space to operate - even to delete backup archives. There is a `--save-space` option for some commands, but even with that Borg will need free space to operate.

You can use some monitoring process or just include the free space information in your backup log files (you check them regularly anyway, right?).

Also helpful:

- create a big file as a “space reserve”, that you can delete to free space
- if you use LVM: use a LV + a filesystem that you can resize later and have some unallocated PEs you can add to the LV.
- consider using quotas
- use *prune* regularly

A step by step example

1. Before a backup can be made a repository has to be initialized:

```
$ borg init /mnt/backup
```

2. Backup the `~/src` and `~/Documents` directories into an archive called *Monday*:

```
$ borg create /mnt/backup::Monday ~/src ~/Documents
```

3. The next day create a new archive called *Tuesday*:

```
$ borg create -v --stats /mnt/backup::Tuesday ~/src ~/Documents
```

This backup will be a lot quicker and a lot smaller since only new never before seen data is stored. The `--stats` option causes Borg to output statistics about the newly created archive such as the amount of unique data (not shared with other archives):

```
-----
Archive name: Tuesday
Archive fingerprint: bd31004d58f51ea06ff735d2e5ac49376901b21d58035f8fb05dbf866566e3c2
Time (start): Tue, 2016-02-16 18:15:11
Time (end):   Tue, 2016-02-16 18:15:11

Duration: 0.19 seconds
Number of files: 127
-----

```

	Original size	Compressed size	Deduplicated size
This archive:	4.16 MB	4.17 MB	26.78 kB
All archives:	8.33 MB	8.34 MB	4.19 MB

```
-----

```

	Unique chunks	Total chunks
Chunk index:	132	261

```
-----
```

4. List all archives in the repository:

```
$ borg list /mnt/backup
Monday                Mon, 2016-02-15 19:14:44
Tuesday              Tue, 2016-02-16 19:15:11
```

5. List the contents of the *Monday* archive:

```
$ borg list /mnt/backup::Monday
drwxr-xr-x user  group          0 Mon, 2016-02-15 18:22:30 home/user/Documents
-rw-r--r-- user  group      7961 Mon, 2016-02-15 18:22:30 home/user/Documents/Important.doc
...
```

6. Restore the *Monday* archive:

```
$ borg extract /mnt/backup::Monday
```

7. Recover disk space by manually deleting the *Monday* archive:

```
$ borg delete /mnt/backup::Monday
```

Note: Borg is quiet by default (it works on WARNING log level). Add the `-v` (or `--verbose` or `--info`) option to adjust the log level to INFO and also use options like `--progress` or `--list` to get progress reporting during command execution.

Automating backups

The following example script backs up `/home` and `/var/www` to a remote server. The script also uses the `borg prune` subcommand to maintain a certain number of old archives:

```
#!/bin/sh
REPOSITORY=username@remoteserver.com:backup

# Backup all of /home and /var/www except a few
# excluded directories
borg create -v --stats \
  $REPOSITORY::`hostname`-`date +%Y-%m-%d` \
  /home \
  /var/www \
  --exclude '/home/*/.cache' \
  --exclude /home/Ben/Music/Justin\ Bieber \
  --exclude '*.pyc'

# Use the `prune` subcommand to maintain 7 daily, 4 weekly and 6 monthly
# archives of THIS machine. --prefix `hostname`- is very important to
# limit prune's operation to this machine's archives and not apply to
# other machine's archives also.
borg prune -v $REPOSITORY --prefix `hostname`- \
  --keep-daily=7 --keep-weekly=4 --keep-monthly=6
```

Backup compression

Default is no compression, but we support different methods with high speed or high compression:

If you have a fast repo storage and you want some compression:

```
$ borg create --compression lz4 /mnt/backup::repo ~
```

If you have a less fast repo storage and you want a bit more compression (N=0..9, 0 means no compression, 9 means high compression):

```
$ borg create --compression zlib,N /mnt/backup::repo ~
```

If you have a very slow repo storage and you want high compression ($N=0..9$, 0 means low compression, 9 means high compression):

```
$ borg create --compression lzma,N /mnt/backup::repo ~
```

You'll need to experiment a bit to find the best compression for your use case. Keep an eye on CPU load and throughput.

Repository encryption

Repository encryption can be enabled or disabled at repository creation time (the default is enabled, with *repokey* method):

```
$ borg init --encryption=none|repokey|keyfile PATH
```

When repository encryption is enabled all data is encrypted using 256-bit [AES](#) encryption and the integrity and authenticity is verified using [HMAC-SHA256](#).

All data is encrypted on the client before being written to the repository. This means that an attacker who manages to compromise the host containing an encrypted archive will not be able to access any of the data, even while the backup is being made.

Borg supports different methods to store the AES and HMAC keys.

repokey mode The key is stored inside the repository (in its “config” file). Use this mode if you trust in your good passphrase giving you enough protection. The repository server never sees the plaintext key.

keyfile mode The key is stored on your local disk (in `~/ .config/borg/keys/`). Use this mode if you want “passphrase and having-the-key” security.

In both modes, the key is stored in encrypted form and can be only decrypted by providing the correct passphrase.

For automated backups the passphrase can be specified using the `BORG_PASSPHRASE` environment variable.

Note: Be careful about how you set that environment, see [this note about password environments](#) for more information.

Warning: The repository data is totally inaccessible without the key and the key passphrase. Make a backup copy of the key file (*keyfile* mode) or repo config file (*repokey* mode) and keep it at a safe place, so you still have the key in case it gets corrupted or lost. Also keep your passphrase at a safe place. The backup that is encrypted with that key/passphrase won't help you with that, of course.

Remote repositories

Borg can initialize and access repositories on remote hosts if the host is accessible using SSH. This is fastest and easiest when Borg is installed on the remote host, in which case the following syntax is used:

```
$ borg init user@hostname:/mnt/backup
```

or:

```
$ borg init ssh://user@hostname:port//mnt/backup
```

Remote operations over SSH can be automated with SSH keys. You can restrict the use of the SSH keypair by prepending a forced command to the SSH public key in the remote server's `authorized_keys` file. This example will start Borg in server mode and limit it to a specific filesystem path:

```
command="borg serve --restrict-to-path /mnt/backup",no-pty,no-agent-forwarding,no-port-forwarding,no-
```

If it is not possible to install Borg on the remote host, it is still possible to use the remote host to store a repository by mounting the remote filesystem, for example, using `sshfs`:

```
$ sshfs user@hostname:/mnt /mnt
$ borg init /mnt/backup
$ fusermount -u /mnt
```

Usage

Borg consists of a number of commands. Each command accepts a number of arguments and options. The following sections will describe each command in detail.

General

Type of log output The log level of the builtin logging configuration defaults to `WARNING`. This is because we want Borg to be mostly silent and only output warnings, errors and critical messages.

Log levels: `DEBUG < INFO < WARNING < ERROR < CRITICAL`

Use `--debug` to set `DEBUG` log level - to get debug, info, warning, error and critical level output.

Use `--info` (or `-v` or `--verbose`) to set `INFO` log level - to get info, warning, error and critical level output.

Use `--warning` (default) to set `WARNING` log level - to get warning, error and critical level output.

Use `--error` to set `ERROR` log level - to get error and critical level output.

Use `--critical` to set `CRITICAL` log level - to get critical level output.

While you can set misc. log levels, do not expect that every command will give different output on different log levels - it's just a possibility.

Warning: Options `--critical` and `--error` are provided for completeness, their usage is not recommended as you might miss important information.

Warning: While some options (like `--stats` or `--list`) will emit more informational messages, you have to use `INFO` (or lower) log level to make them show up in log output. Use `-v` or a logging configuration.

Return codes Borg can exit with the following return codes (rc):

```
0 = success (logged as INFO)
1 = warning (operation reached its normal end, but there were warnings -
you should check the log, logged as WARNING)
2 = error (like a fatal error, a local or remote exception, the operation
did not reach its normal end, logged as ERROR)
128+N = killed by signal N (e.g. 137 == kill -9)
```

If you use `--show-rc`, the return code is also logged at the indicated level as the last log entry.

Environment Variables Borg uses some environment variables for automation:

General:

BORG_REPO When set, use the value to give the default repository location. If a command needs an archive parameter, you can abbreviate as `::archive`. If a command needs a repository parameter, you can either leave it away or abbreviate as `::`, if a positional parameter is required.

BORG_PASSPHRASE When set, use the value to answer the passphrase question for encrypted repositories.

BORG_DISPLAY_PASSPHRASE When set, use the value to answer the “display the passphrase for verification” question when defining a new passphrase for encrypted repositories.

BORG_LOGGING_CONF When set, use the given filename as **INI**-style logging configuration.

BORG_RSH When set, use this command instead of `ssh`. This can be used to specify `ssh` options, such as a custom identity file `ssh -i /path/to/private/key`. See `man ssh` for other options.

TMPDIR where temporary files are stored (might need a lot of temporary space for some operations)

Some automatic “answers” (if set, they automatically answer confirmation questions):

BORG_UNKNOWN_UNENCRYPTED_REPO_ACCESS_IS_OK=no (or =yes) For “Warning: Attempting to access a previously unknown unencrypted repository”

BORG_RELOCATED_REPO_ACCESS_IS_OK=no (or =yes) For “Warning: The repository at location ... was previously located at ...”

BORG_CHECK_I_KNOW_WHAT_I_AM_DOING=NO (or =YES) For “Warning: ‘check -repair’ is an experimental feature that might result in data loss.”

BORG_DELETE_I_KNOW_WHAT_I_AM_DOING=NO (or =YES) For “You requested to completely DELETE the repository *including* all archives it contains:”

Note: answers are case sensitive. setting an invalid answer value might either give the default answer or ask you interactively, depending on whether retries are allowed (they by default are allowed). So please test your scripts interactively before making them a non-interactive script.

Directories:

BORG_KEYS_DIR Default to `~/config/borg/keys`. This directory contains keys for encrypted repositories.

BORG_CACHE_DIR Default to `~/cache/borg`. This directory contains the local cache and might need a lot of space for dealing with big repositories).

Building:

BORG_OPENSSL_PREFIX Adds given OpenSSL header file directory to the default locations (setup.py).

BORG_LZ4_PREFIX Adds given LZ4 header file directory to the default locations (setup.py).

Please note:

- be very careful when using the “yes” sayers, the warnings with prompt exist for your / your data’s security/safety
- also be very careful when putting your passphrase into a script, make sure it has appropriate file permissions (e.g. mode 600, root:root).

Resource Usage Borg might use a lot of resources depending on the size of the data set it is dealing with.

CPU: It won’t go beyond 100% of 1 core as the code is currently single-threaded. Especially higher zlib and lzma compression levels use significant amounts of CPU cycles.

Memory (RAM): The chunks index and the files index are read into memory for performance reasons. Compression, esp. lzma compression with high levels might need substantial amounts of memory.

Temporary files: Reading data and metadata from a FUSE mounted repository will consume about the same space as the deduplicated chunks used to represent them in the repository.

Cache files: Contains the chunks index and files index (plus a compressed collection of single-archive chunk indexes).

Chunks index: Proportional to the amount of data chunks in your repo. Lots of chunks in your repo imply a big chunks index. It is possible to tweak the chunker params (see create options).

Files index: Proportional to the amount of files in your last backup. Can be switched off (see create options), but next backup will be much slower if you do.

Network: If your repository is remote, all deduplicated (and optionally compressed/ encrypted) data of course has to go over the connection (ssh: repo url). If you use a locally mounted network filesystem, additionally some copy operations used for transaction support also go over the connection. If you backup multiple sources to one target repository, additional traffic happens for cache resynchronization.

In case you are interested in more details, please read the internals documentation.

Units To display quantities, Borg takes care of respecting the usual conventions of scale. Disk sizes are displayed in **decimal**, using powers of ten (so kB means 1000 bytes). For memory usage, **binary prefixes** are used, and are indicated using the **IEC binary prefixes**, using powers of two (so KiB means 1024 bytes).

Date and Time We format date and time conforming to ISO-8601, that is: YYYY-MM-DD and HH:MM:SS (24h clock).

For more information about that, see: <https://xkcd.com/1179/>

Unless otherwise noted, we display local date and time. Internally, we store and process date and time as UTC.

borg init

```
usage: borg init [-h] [--critical] [--error] [--warning] [--info] [--debug]
               [--lock-wait N] [--show-rc] [--no-files-cache] [--umask M]
               [--remote-path PATH] [-e {none,keyfile,repokey}]
               [REPOSITORY]

Initialize an empty repository

positional arguments:
  REPOSITORY            repository to create

optional arguments:
  -h, --help            show this help message and exit
  --critical            work on log level CRITICAL
  --error              work on log level ERROR
  --warning            work on log level WARNING (default)
  --info, -v, --verbose
                       work on log level INFO
  --debug              work on log level DEBUG
  --lock-wait N        wait for the lock, but max. N seconds (default: 1).
  --show-rc            show/log the return code (rc)
  --no-files-cache     do not load/update the file metadata cache used to
                       detect unchanged files
  --umask M            set umask to M (local and remote, default: 0077)
  --remote-path PATH   set remote path to executable (default: "borg")
  -e {none,keyfile,repokey}, --encryption {none,keyfile,repokey}
                       select encryption key mode (default: "repokey")
```

Description This command initializes an empty repository. A repository is a filesystem directory containing the deduplicated data from zero or more archives. Encryption can be enabled at repository init time.

Examples

```
# Local repository (default is to use encryption in repokey mode)
$ borg init /mnt/backup

# Local repository (no encryption)
$ borg init --encryption=none /mnt/backup

# Remote repository (accesses a remote borg via ssh)
$ borg init user@hostname:backup

# Remote repository (store the key your home dir)
$ borg init --encryption=keyfile user@hostname:backup
```

Important notes about encryption:

It is not recommended to disable encryption. Repository encryption protects you e.g. against the case that an attacker has access to your backup repository.

But be careful with the key / the passphrase:

If you want “passphrase-only” security, use the `repokey` mode. The key will be stored inside the repository (in its “config” file). In above mentioned attack scenario, the attacker will have the key (but not the passphrase).

If you want “passphrase and having-the-key” security, use the `keyfile` mode. The key will be stored in your home directory (in `.config/borg/keys`). In the attack scenario, the attacker who has just access to your repo won’t have the key (and also not the passphrase).

Make a backup copy of the key file (`keyfile` mode) or repo config file (`repokey` mode) and keep it at a safe place, so you still have the key in case it gets corrupted or lost. Also keep the passphrase at a safe place. The backup that is encrypted with that key won’t help you with that, of course.

Make sure you use a good passphrase. Not too short, not too simple. The real encryption / decryption key is encrypted with / locked by your passphrase. If an attacker gets your key, he can’t unlock and use it without knowing the passphrase.

Be careful with special or non-ascii characters in your passphrase:

- Borg processes the passphrase as unicode (and encodes it as utf-8), so it does not have problems dealing with even the strangest characters.
- BUT: that does not necessarily apply to your OS / VM / keyboard configuration.

So better use a long passphrase made from simple ascii chars than one that includes non-ascii stuff or characters that are hard/impossible to enter on a different keyboard layout.

You can change your passphrase for existing repos at any time, it won’t affect the encryption/decryption key or other secrets.

borg create

```
usage: borg create [-h] [--critical] [--error] [--warning] [--info] [--debug]
                  [--lock-wait N] [--show-rc] [--no-files-cache] [--umask M]
                  [--remote-path PATH] [-s] [-p] [--list]
                  [--filter STATUSCHARS] [-e PATTERN]
                  [--exclude-from EXCLUDEFILE] [--exclude-caches]
                  [--exclude-if-present FILENAME] [--keep-tag-files]
```

```

[-c SECONDS] [-x] [--numeric-owner]
[--timestamp yyyy-mm-ddThh:mm:ss]
[--chunker-params CHUNK_MIN_EXP,CHUNK_MAX_EXP,HASH_MASK_BITS,HASH_WINDOW_SIZE]
[--ignore-inode] [-C COMPRESSION] [--read-special] [-n]
ARCHIVE PATH [PATH ...]

```

Create new archive

positional arguments:

```

ARCHIVE      name of archive to create (must be also a valid
              directory name)
PATH         paths to archive

```

optional arguments:

```

-h, --help          show this help message and exit
--critical          work on log level CRITICAL
--error            work on log level ERROR
--warning          work on log level WARNING (default)
--info, -v, --verbose
                  work on log level INFO
--debug            work on log level DEBUG
--lock-wait N      wait for the lock, but max. N seconds (default: 1).
--show-rc          show/log the return code (rc)
--no-files-cache   do not load/update the file metadata cache used to
                  detect unchanged files
--umask M          set umask to M (local and remote, default: 0077)
--remote-path PATH set remote path to executable (default: "borg")
-s, --stats        print statistics for the created archive
-p, --progress     show progress display while creating the archive,
                  showing Original, Compressed and Deduplicated sizes,
                  followed by the Number of files seen and the path
                  being processed, default: False
--list             output verbose list of items (files, dirs, ...)
--filter STATUSCHARS only display items with the given status characters
-e PATTERN, --exclude PATTERN
                  exclude paths matching PATTERN
--exclude-from EXCLUDEFILE
                  read exclude patterns from EXCLUDEFILE, one per line
--exclude-caches   exclude directories that contain a CACHEDIR.TAG file
                  (http://www.brynosaurus.com/cachedir/spec.html)
--exclude-if-present FILENAME
                  exclude directories that contain the specified file
--keep-tag-files   keep tag files of excluded caches/directories
-c SECONDS, --checkpoint-interval SECONDS
                  write checkpoint every SECONDS seconds (Default: 300)
-x, --one-file-system
                  stay in same file system, do not cross mount points
--numeric-owner    only store numeric user and group identifiers
--timestamp yyyy-mm-ddThh:mm:ss
                  manually specify the archive creation date/time (UTC).
                  alternatively, give a reference file/directory.
--chunker-params CHUNK_MIN_EXP,CHUNK_MAX_EXP,HASH_MASK_BITS,HASH_WINDOW_SIZE
                  specify the chunker parameters. default: 19,23,21,4095
--ignore-inode     ignore inode data in the file metadata cache used to
                  detect unchanged files.
-C COMPRESSION, --compression COMPRESSION
                  select compression algorithm (and level): none == no
                  compression (default), lz4 == lz4, zlib == zlib

```

```
(default level 6), zlib,0 .. zlib,9 == zlib (with
level 0..9), lzma == lzma (default level 6), lzma,0 ..
lzma,9 == lzma (with level 0..9).
--read-special    open and read special files as if they were regular
                  files
-n, --dry-run     do not create a backup archive
```

Description This command creates a backup archive containing all files found while recursively traversing all paths specified. The archive will consume almost no disk space for files or parts of files that have already been stored in other archives.

To speed up pulling backups over sshfs and similar network file systems which do not provide correct inode information the `--ignore-inode` flag can be used. This potentially decreases reliability of change detection, while avoiding always reading all files on these file systems.

See the output of the “borg help patterns” command for more help on exclude patterns.

Examples

```
# Backup ~/Documents into an archive named "my-documents"
$ borg create /mnt/backup::my-documents ~/Documents

# same, but verbosely list all files as we process them
$ borg create -v --list /mnt/backup::my-documents ~/Documents

# Backup ~/Documents and ~/src but exclude pyc files
$ borg create /mnt/backup::my-files \
  ~/Documents \
  ~/src \
  --exclude '*.pyc'

# Backup home directories excluding image thumbnails (i.e. only
# /home/*/.thumbnails is excluded, not /home/*/*/.thumbnails)
$ borg create /mnt/backup::my-files /home \
  --exclude 're:^(/home/[^/]+/\.thumbnails/'

# Do the same using a shell-style pattern
$ borg create /mnt/backup::my-files /home \
  --exclude 'sh:/home/*/.thumbnails'

# Backup the root filesystem into an archive named "root-YYYY-MM-DD"
# use zlib compression (good, but slow) - default is no compression
$ borg create -C zlib,6 /mnt/backup::root-{now:%Y-%m-%d} / --one-file-system

# Make a big effort in fine granular deduplication (big chunk management
# overhead, needs a lot of RAM and disk space, see formula in internals
# docs - same parameters as borg < 1.0 or attic):
$ borg create --chunker-params 10,23,16,4095 /mnt/backup::small /smallstuff

# Backup a raw device (must not be active/in use/mounted at that time)
$ dd if=/dev/sdx bs=10M | borg create /mnt/backup::my-sdx -

# No compression (default)
$ borg create /mnt/backup::repo ~

# Super fast, low compression
$ borg create --compression lz4 /mnt/backup::repo ~
```

```
# Less fast, higher compression (N = 0..9)
$ borg create --compression zlib,N /mnt/backup::repo ~

# Even slower, even higher compression (N = 0..9)
$ borg create --compression lzma,N /mnt/backup::repo ~

# Format tags available for archive name:
# {now}, {utcnow}, {fqdn}, {hostname}, {user}, {pid}
# add short hostname, backup username and current unixtime (seconds from epoch)
$ borg create /mnt/backup::{hostname}-{user}-{now:%s} ~
```

borg extract

```
usage: borg extract [-h] [--critical] [--error] [--warning] [--info] [--debug]
                  [--lock-wait N] [--show-rc] [--no-files-cache] [--umask M]
                  [--remote-path PATH] [--list] [-n] [-e PATTERN]
                  [--exclude-from EXCLUDEFILE] [--numeric-owner]
                  [--strip-components NUMBER] [--stdout] [--sparse]
                  ARCHIVE [PATH [PATH ...]]
```

Extract archive contents

positional arguments:

```
  ARCHIVE      archive to extract
  PATH         paths to extract; patterns are supported
```

optional arguments:

```
-h, --help          show this help message and exit
--critical          work on log level CRITICAL
--error            work on log level ERROR
--warning          work on log level WARNING (default)
--info, -v, --verbose
                  work on log level INFO
--debug            work on log level DEBUG
--lock-wait N      wait for the lock, but max. N seconds (default: 1).
--show-rc          show/log the return code (rc)
--no-files-cache   do not load/update the file metadata cache used to
                  detect unchanged files
--umask M          set umask to M (local and remote, default: 0077)
--remote-path PATH set remote path to executable (default: "borg")
--list             output verbose list of items (files, dirs, ...)
-n, --dry-run      do not actually change any files
-e PATTERN, --exclude PATTERN
                  exclude paths matching PATTERN
--exclude-from EXCLUDEFILE
                  read exclude patterns from EXCLUDEFILE, one per line
--numeric-owner    only obey numeric user and group identifiers
--strip-components NUMBER
                  Remove the specified number of leading path elements.
                  Pathnames with fewer elements will be silently
                  skipped.
--stdout           write all extracted data to stdout
--sparse           create holes in output sparse file from all-zero
                  chunks
```

Description This command extracts the contents of an archive. By default the entire archive is extracted but a subset of files and directories can be selected by passing a list of PATHs as arguments. The file selection can further be restricted by using the `--exclude` option.

See the output of the “`borg help patterns`” command for more help on exclude patterns.

Examples

```
# Extract entire archive
$ borg extract /mnt/backup::my-files

# Extract entire archive and list files while processing
$ borg extract -v --list /mnt/backup::my-files

# Extract the "src" directory
$ borg extract /mnt/backup::my-files home/USERNAME/src

# Extract the "src" directory but exclude object files
$ borg extract /mnt/backup::my-files home/USERNAME/src --exclude '*.o'

# Restore a raw device (must not be active/in use/mounted at that time)
$ borg extract --stdout /mnt/backup::my-sdx | dd of=/dev/sdx bs=10M
```

Note: currently, `extract` always writes into the current working directory (“.”), so make sure you `cd` to the right place before calling `borg extract`.

borg check

```
usage: borg check [-h] [--critical] [--error] [--warning] [--info] [--debug]
                 [--lock-wait N] [--show-rc] [--no-files-cache] [--umask M]
                 [--remote-path PATH] [--repository-only] [--archives-only]
                 [--repair] [--save-space] [--last N] [-P PREFIX]
                 [REPOSITORY_OR_ARCHIVE]

Check repository consistency

positional arguments:
  REPOSITORY_OR_ARCHIVE
                        repository or archive to check consistency of

optional arguments:
  -h, --help            show this help message and exit
  --critical            work on log level CRITICAL
  --error              work on log level ERROR
  --warning            work on log level WARNING (default)
  --info, -v, --verbose
                        work on log level INFO
  --debug             work on log level DEBUG
  --lock-wait N        wait for the lock, but max. N seconds (default: 1).
  --show-rc           show/log the return code (rc)
  --no-files-cache    do not load/update the file metadata cache used to
                        detect unchanged files
  --umask M           set umask to M (local and remote, default: 0077)
  --remote-path PATH  set remote path to executable (default: "borg")
  --repository-only   only perform repository checks
  --archives-only     only perform archives checks
  --repair            attempt to repair any inconsistencies found
```

```

--save-space          work slower, but using less space
--last N             only check last N archives (Default: all)
-P PREFIX, --prefix PREFIX
                    only consider archive names starting with this prefix

```

Description The check command verifies the consistency of a repository and the corresponding archives.

First, the underlying repository data files are checked:

- For all segments the segment magic (header) is checked
- For all objects stored in the segments, all metadata (e.g. crc and size) and all data is read. The read data is checked by size and CRC. Bit rot and other types of accidental damage can be detected this way.
- If we are in repair mode and a integrity error is detected for a segment, we try to recover as many objects from the segment as possible.
- In repair mode, it makes sure that the index is consistent with the data stored in the segments.
- If you use a remote repo server via ssh:, the repo check is executed on the repo server without causing significant network traffic.
- The repository check can be skipped using the `--archives-only` option.

Second, the consistency and correctness of the archive metadata is verified:

- Is the repo manifest present? If not, it is rebuilt from archive metadata chunks (this requires reading and decrypting of all metadata and data).
- Check if archive metadata chunk is present. if not, remove archive from manifest.
- For all files (items) in the archive, for all chunks referenced by these files, check if chunk is present (if not and we are in repair mode, replace it with a same-size chunk of zeros). This requires reading of archive and file metadata, but not data.
- If we are in repair mode and we checked all the archives: delete orphaned chunks from the repo.
- if you use a remote repo server via ssh:, the archive check is executed on the client machine (because if encryption is enabled, the checks will require decryption and this is always done client-side, because key access will be required).
- The archive checks can be time consuming, they can be skipped using the `--repository-only` option.

borg rename

```

usage: borg rename [-h] [--critical] [--error] [--warning] [--info] [--debug]
                  [--lock-wait N] [--show-rc] [--no-files-cache] [--umask M]
                  [--remote-path PATH]
                  ARCHIVE NEWNAME

```

Rename an existing archive

positional arguments:

```

ARCHIVE          archive to rename
NEWNAME          the new archive name to use

```

optional arguments:

```

-h, --help          show this help message and exit
--critical          work on log level CRITICAL
--error            work on log level ERROR

```

```
--warning          work on log level WARNING (default)
--info, -v, --verbose
--debug           work on log level INFO
--lock-wait N     wait for the lock, but max. N seconds (default: 1).
--show-rc        show/log the return code (rc)
--no-files-cache  do not load/update the file metadata cache used to
                  detect unchanged files
--umask M        set umask to M (local and remote, default: 0077)
--remote-path PATH set remote path to executable (default: "borg")
```

Description This command renames an archive in the repository.

Examples

```
$ borg create /mnt/backup::archivename ~
$ borg list /mnt/backup
archivename                               Mon, 2016-02-15 19:50:19

$ borg rename /mnt/backup::archivename newname
$ borg list /mnt/backup
newname                                   Mon, 2016-02-15 19:50:19
```

borg list

```
usage: borg list [-h] [--critical] [--error] [--warning] [--info] [--debug]
                [--lock-wait N] [--show-rc] [--no-files-cache] [--umask M]
                [--remote-path PATH] [--short] [--list-format LISTFORMAT]
                [-P PREFIX]
                [REPOSITORY_OR_ARCHIVE]

List archive or repository contents

positional arguments:
  REPOSITORY_OR_ARCHIVE
                        repository/archive to list contents of

optional arguments:
  -h, --help            show this help message and exit
  --critical            work on log level CRITICAL
  --error               work on log level ERROR
  --warning             work on log level WARNING (default)
  --info, -v, --verbose
                        work on log level INFO
  --debug              work on log level DEBUG
  --lock-wait N        wait for the lock, but max. N seconds (default: 1).
  --show-rc            show/log the return code (rc)
  --no-files-cache     do not load/update the file metadata cache used to
                        detect unchanged files
  --umask M            set umask to M (local and remote, default: 0077)
  --remote-path PATH   set remote path to executable (default: "borg")
  --short              only print file/directory names, nothing else
  --list-format LISTFORMAT
                        specify format for archive file listing (default:
                        "{mode} {user:6} {group:6} {size:8d} {isomtime}")
```

```

        {path}{extra}{NEWLINE}") Special "{formatkeys}" exists
        to list available keys
-P PREFIX, --prefix PREFIX
        only consider archive names starting with this prefix

```

Description This command lists the contents of a repository or an archive.

Examples

```

$ borg list /mnt/backup
Monday                               Mon, 2016-02-15 19:15:11

```

borg delete

```

usage: borg delete [-h] [--critical] [--error] [--warning] [--info] [--debug]
                  [--lock-wait N] [--show-rc] [--no-files-cache] [--umask M]
                  [--remote-path PATH] [-p] [-s] [-c] [--save-space]
                  [TARGET]

```

Delete an existing repository or archive

positional arguments:

TARGET archive or repository to delete

optional arguments:

-h, --help show this help message and exit

```
--critical          work on log level CRITICAL
--error            work on log level ERROR
--warning          work on log level WARNING (default)
--info, -v, --verbose
                  work on log level INFO
--debug           work on log level DEBUG
--lock-wait N      wait for the lock, but max. N seconds (default: 1).
--show-rc         show/log the return code (rc)
--no-files-cache  do not load/update the file metadata cache used to
                  detect unchanged files
--umask M         set umask to M (local and remote, default: 0077)
--remote-path PATH set remote path to executable (default: "borg")
-p, --progress    show progress display while deleting a single archive
-s, --stats       print statistics for the deleted archive
-c, --cache-only  delete only the local cache for the given repository
--save-space      work slower, but using less space
```

Description This command deletes an archive from the repository or the complete repository. Disk space is reclaimed accordingly. If you delete the complete repository, the local cache for it (if any) is also deleted.

Examples

```
# delete a single backup archive:
$ borg delete /mnt/backup::Monday

# delete the whole repository and the related local cache:
$ borg delete /mnt/backup
You requested to completely DELETE the repository *including* all archives it contains:
repo                               Mon, 2016-02-15 19:26:54
root-2016-02-15                    Mon, 2016-02-15 19:36:29
newname                             Mon, 2016-02-15 19:50:19
Type 'YES' if you understand this and want to continue: YES
```

borg prune

```
usage: borg prune [-h] [--critical] [--error] [--warning] [--info] [--debug]
                 [--lock-wait N] [--show-rc] [--no-files-cache] [--umask M]
                 [--remote-path PATH] [-n] [-s] [--list]
                 [--keep-within WITHIN] [-H HOURLY] [-d DAILY] [-w WEEKLY]
                 [-m MONTHLY] [-y YEARLY] [-P PREFIX] [--save-space]
                 [REPOSITORY]
```

Prune repository archives according to specified rules

positional arguments:

REPOSITORY repository to prune

optional arguments:

```
-h, --help          show this help message and exit
--critical          work on log level CRITICAL
--error            work on log level ERROR
--warning          work on log level WARNING (default)
--info, -v, --verbose
                  work on log level INFO
--debug           work on log level DEBUG
```

```

--lock-wait N          wait for the lock, but max. N seconds (default: 1).
--show-rc              show/log the return code (rc)
--no-files-cache      do not load/update the file metadata cache used to
                      detect unchanged files
--umask M              set umask to M (local and remote, default: 0077)
--remote-path PATH    set remote path to executable (default: "borg")
-n, --dry-run         do not change repository
-s, --stats           print statistics for the deleted archive
--list                output verbose list of archives it keeps/prunes
--keep-within WITHIN keep all archives within this time interval
-H HOURLY, --keep-hourly HOURLY
                      number of hourly archives to keep
-d DAILY, --keep-daily DAILY
                      number of daily archives to keep
-w WEEKLY, --keep-weekly WEEKLY
                      number of weekly archives to keep
-m MONTHLY, --keep-monthly MONTHLY
                      number of monthly archives to keep
-y YEARLY, --keep-yearly YEARLY
                      number of yearly archives to keep
-P PREFIX, --prefix PREFIX
                      only consider archive names starting with this prefix
--save-space          work slower, but using less space

```

Description The prune command prunes a repository by deleting archives not matching any of the specified retention options. This command is normally used by automated backup scripts wanting to keep a certain number of historic backups.

As an example, “-d 7” means to keep the latest backup on each day, up to 7 most recent days with backups (days without backups do not count). The rules are applied from hourly to yearly, and backups selected by previous rules do not count towards those of later rules. The time that each backup completes is used for pruning purposes. Dates and times are interpreted in the local timezone, and weeks go from Monday to Sunday. Specifying a negative number of archives to keep means that there is no limit.

The “--keep-within” option takes an argument of the form “<int><char>”, where char is “H”, “d”, “w”, “m”, “y”. For example, “--keep-within 2d” means to keep all archives that were created within the past 48 hours. “1m” is taken to mean “31d”. The archives kept with this option do not count towards the totals specified by any other options.

If a prefix is set with -P, then only archives that start with the prefix are considered for deletion and only those archives count towards the totals specified by the rules. Otherwise, *all* archives in the repository are candidates for deletion!

Examples Be careful, prune is a potentially dangerous command, it will remove backup archives.

The default of prune is to apply to **all archives in the repository** unless you restrict its operation to a subset of the archives using --prefix. When using --prefix, be careful to choose a good prefix - e.g. do not use a prefix “foo” if you do not also want to match “foobar”.

It is strongly recommended to always run `prune --dry-run . . .` first so you will see what it would do without it actually doing anything.

```

# Keep 7 end of day and 4 additional end of week archives.
# Do a dry-run without actually deleting anything.
$ borg prune --dry-run --keep-daily=7 --keep-weekly=4 /mnt/backup

# Same as above but only apply to archive names starting with "foo":
$ borg prune --keep-daily=7 --keep-weekly=4 --prefix=foo /mnt/backup

```

```
# Keep 7 end of day, 4 additional end of week archives,  
# and an end of month archive for every month:  
$ borg prune --keep-daily=7 --keep-weekly=4 --keep-monthly=-1 /mnt/backup  
  
# Keep all backups in the last 10 days, 4 additional end of week archives,  
# and an end of month archive for every month:  
$ borg prune --keep-within=10d --keep-weekly=4 --keep-monthly=-1 /mnt/backup
```

borg info

```
usage: borg info [-h] [--critical] [--error] [--warning] [--info] [--debug]  
               [--lock-wait N] [--show-rc] [--no-files-cache] [--umask M]  
               [--remote-path PATH]  
               ARCHIVE  
  
Show archive details such as disk space used  
  
positional arguments:  
  ARCHIVE          archive to display information about  
  
optional arguments:  
  -h, --help          show this help message and exit  
  --critical          work on log level CRITICAL  
  --error            work on log level ERROR  
  --warning          work on log level WARNING (default)  
  --info, -v, --verbose  
                    work on log level INFO  
  --debug           work on log level DEBUG  
  --lock-wait N     wait for the lock, but max. N seconds (default: 1).  
  --show-rc         show/log the return code (rc)  
  --no-files-cache  do not load/update the file metadata cache used to  
                    detect unchanged files  
  --umask M         set umask to M (local and remote, default: 0077)  
  --remote-path PATH set remote path to executable (default: "borg")
```

Description This command displays some detailed information about the specified archive.

Examples

```
$ borg info /mnt/backup::root-2016-02-15  
Name: root-2016-02-15  
Fingerprint: 57c827621f21b000a8d363c1e163cc55983822b3afff3a96df595077a660be50  
Hostname: myhostname  
Username: root  
Time (start): Mon, 2016-02-15 19:36:29  
Time (end):   Mon, 2016-02-15 19:39:26  
Command line: /usr/local/bin/borg create -v --list -C zlib,6 /mnt/backup::root-2016-02-15 / --one-file  
Number of files: 38100  
  
                Original size      Compressed size      Deduplicated size  
This archive:    1.33 GB             613.25 MB            571.64 MB  
All archives:    1.63 GB             853.66 MB            584.12 MB  
  
                Unique chunks        Total chunks  
Chunk index:    36858                    48844
```

borg mount

```
usage: borg mount [-h] [--critical] [--error] [--warning] [--info] [--debug]
                [--lock-wait N] [--show-rc] [--no-files-cache] [--umask M]
                [--remote-path PATH] [-f] [-o OPTIONS]
                REPOSITORY_OR_ARCHIVE MOUNTPOINT
```

Mount archive or an entire repository as a FUSE filesystem

positional arguments:

```
REPOSITORY_OR_ARCHIVE    repository/archive to mount
MOUNTPOINT               where to mount filesystem
```

optional arguments:

```
-h, --help                show this help message and exit
--critical                work on log level CRITICAL
--error                  work on log level ERROR
--warning                work on log level WARNING (default)
--info, -v, --verbose    work on log level INFO
--debug                  work on log level DEBUG
--lock-wait N            wait for the lock, but max. N seconds (default: 1).
--show-rc                show/log the return code (rc)
--no-files-cache         do not load/update the file metadata cache used to
                        detect unchanged files
--umask M                set umask to M (local and remote, default: 0077)
--remote-path PATH       set remote path to executable (default: "borg")
-f, --foreground         stay in foreground, do not daemonize
-o OPTIONS                Extra mount options
```

Description This command mounts an archive as a FUSE filesystem. This can be useful for browsing an archive or restoring individual files. Unless the `--foreground` option is given the command will run in the background until the filesystem is unmounted.

Examples

```
$ borg mount /mnt/backup::root-2016-02-15 /tmp/mymountpoint
$ ls /tmp/mymountpoint
bin boot etc home lib lib64 lost+found media mnt opt root sbin srv tmp usr var
$ fusermount -u /tmp/mymountpoint
```

borg change-passphrase

```
usage: borg change-passphrase [-h] [--critical] [--error] [--warning] [--info]
                              [--debug] [--lock-wait N] [--show-rc]
                              [--no-files-cache] [--umask M]
                              [--remote-path PATH]
                              [REPOSITORY]
```

Change repository key file passphrase

positional arguments:

```
REPOSITORY
```

```
optional arguments:
  -h, --help                show this help message and exit
  --critical                work on log level CRITICAL
  --error                  work on log level ERROR
  --warning                 work on log level WARNING (default)
  --info, -v, --verbose    work on log level INFO
  --debug                  work on log level DEBUG
  --lock-wait N            wait for the lock, but max. N seconds (default: 1).
  --show-rc                show/log the return code (rc)
  --no-files-cache        do not load/update the file metadata cache used to
                          detect unchanged files
  --umask M                set umask to M (local and remote, default: 0077)
  --remote-path PATH      set remote path to executable (default: "borg")
```

Description The key files used for repository encryption are optionally passphrase protected. This command can be used to change this passphrase.

Examples

```
# Create a key file protected repository
$ borg init --encryption=keyfile -v /mnt/backup
Initializing repository at "/mnt/backup"
Enter new passphrase:
Enter same passphrase again:
Remember your passphrase. Your data will be inaccessible without it.
Key in "/root/.config/borg/keys/mnt_backup" created.
Keep this key safe. Your data will be inaccessible without it.
Synchronizing chunks...
Archives: 0, w/ cached Idx: 0, w/ outdated Idx: 0, w/o cached Idx: 0.
Done.

# Change key file passphrase
$ borg change-passphrase -v /mnt/backup
Enter passphrase for key /root/.config/borg/keys/mnt_backup:
Enter new passphrase:
Enter same passphrase again:
Remember your passphrase. Your data will be inaccessible without it.
Key updated
```

borg serve

```
usage: borg serve [-h] [--critical] [--error] [--warning] [--info] [--debug]
                 [--lock-wait N] [--show-rc] [--no-files-cache] [--umask M]
                 [--remote-path PATH] [--restrict-to-path PATH]
```

Start in server mode. This command is usually not used manually.

```
optional arguments:
  -h, --help                show this help message and exit
  --critical                work on log level CRITICAL
  --error                  work on log level ERROR
  --warning                 work on log level WARNING (default)
  --info, -v, --verbose    work on log level INFO
```

```

--debug                work on log level INFO
--lock-wait N          wait for the lock, but max. N seconds (default: 1).
--show-rc              show/log the return code (rc)
--no-files-cache       do not load/update the file metadata cache used to
                        detect unchanged files
--umask M              set umask to M (local and remote, default: 0077)
--remote-path PATH     set remote path to executable (default: "borg")
--restrict-to-path PATH
                        restrict repository access to PATH

```

Description This command starts a repository server process. This command is usually not used manually.

Examples `borg serve` has special support for ssh forced commands (see `authorized_keys` example below): it will detect that you use such a forced command and extract the value of the `--restrict-to-path` option(s). It will then parse the original command that came from the client, makes sure that it is also `borg serve` and enforce path restriction(s) as given by the forced command. That way, other options given by the client (like `--info` or `--umask`) are preserved (and are not fixed by the forced command).

```

# Allow an SSH keypair to only run borg, and only have access to /mnt/backup.
# Use key options to disable unneeded and potentially dangerous SSH functionality.
# This will help to secure an automated remote backup system.
$ cat ~/.ssh/authorized_keys
command="borg serve --restrict-to-path /mnt/backup",no-pty,no-agent-forwarding,no-port-forwarding,no-

```

borg upgrade

```

usage: borg upgrade [-h] [--critical] [--error] [--warning] [--info] [--debug]
                  [--lock-wait N] [--show-rc] [--no-files-cache] [--umask M]
                  [--remote-path PATH] [-p] [-n] [-i]
                  [REPOSITORY]

```

upgrade a repository from a previous version

positional arguments:

```

REPOSITORY          path to the repository to be upgraded

```

optional arguments:

```

-h, --help          show this help message and exit
--critical          work on log level CRITICAL
--error             work on log level ERROR
--warning           work on log level WARNING (default)
--info, -v, --verbose
--debug            work on log level INFO
--lock-wait N      wait for the lock, but max. N seconds (default: 1).
--show-rc          show/log the return code (rc)
--no-files-cache   do not load/update the file metadata cache used to
                    detect unchanged files
--umask M          set umask to M (local and remote, default: 0077)
--remote-path PATH set remote path to executable (default: "borg")
-p, --progress     show progress display while upgrading the repository
-n, --dry-run      do not change repository

```

```
-i, --inplace      rewrite repository in place, with no chance of going
                   back to older versions of the repository.
```

Description Upgrade an existing Borg repository. This currently supports converting an Attic repository to Borg and also helps with converting Borg 0.xx to 1.0.

Currently, only LOCAL repositories can be upgraded (issue #465).

It will change the magic strings in the repository's segments to match the new Borg magic strings. The keyfiles found in \$ATTIC_KEYS_DIR or ~/.attic/keys/ will also be converted and copied to \$BORG_KEYS_DIR or ~/.config/borg/keys.

The cache files are converted, from \$ATTIC_CACHE_DIR or ~/.cache/attic to \$BORG_CACHE_DIR or ~/.cache/borg, but the cache layout between Borg and Attic changed, so it is possible the first backup after the conversion takes longer than expected due to the cache resync.

Upgrade should be able to resume if interrupted, although it will still iterate over all segments. If you want to start from scratch, use *borg delete* over the copied repository to make sure the cache files are also removed:

```
borg delete borg
```

Unless `--inplace` is specified, the upgrade process first creates a backup copy of the repository, in `REPOSITORY.upgrade-DATETIME`, using hardlinks. This takes longer than in place upgrades, but is much safer and gives progress information (as opposed to `cp -al`). Once you are satisfied with the conversion, you can safely destroy the backup copy.

WARNING: Running the upgrade in place will make the current copy unusable with older version, with no way of going back to previous versions. This can **PERMANENTLY DAMAGE YOUR REPOSITORY!** Attic **CAN NOT READ BORG REPOSITORIES**, as the magic strings have changed. You have been warned.

Examples

```
# Upgrade the borg repository to the most recent version.
$ borg upgrade -v /mnt/backup
making a hardlink copy in /mnt/backup.upgrade-2016-02-15-20:51:55
opening attic repository with borg and converting
no key file found for repository
converting repo index /mnt/backup/index.0
converting 1 segments...
converting borg 0.xx to borg current
no key file found for repository
```

Miscellaneous Help

borg help patterns Exclusion patterns support four separate styles, fnmatch, shell, regular expressions and path prefixes. If followed by a colon (':') the first two characters of a pattern are used as a style selector. Explicit style selection is necessary when a non-default style is desired or when the desired pattern starts with two alphanumeric characters followed by a colon (i.e. *aa:something/**).

Fnmacth, selector *fm*:

These patterns use a variant of shell pattern syntax, with '*' matching any number of characters, '?' matching any single character, '['...] matching any single character specified, including ranges, and '[!...]' matching any character not specified. For the purpose of these patterns, the path separator ('' for Windows and '/' on other systems) is not treated specially. Wrap meta-characters in brackets for a literal match (i.e. [?]) to match the literal character (?). For a path to match a pattern, it must completely match from start to end, or must match from the start to just before a path separator. Except for the root path, paths will never

end in the path separator when matching is attempted. Thus, if a given pattern ends in a path separator, a `**` is appended before matching is attempted.

Shell-style patterns, selector *sh*:

Like `fnmatch` patterns these are similar to shell patterns. The difference is that the pattern may include `**/` for matching zero or more directory levels, `*` for matching zero or more arbitrary characters with the exception of any path separator.

Regular expressions, selector *re*:

Regular expressions similar to those found in Perl are supported. Unlike shell patterns regular expressions are not required to match the complete path and any substring match is sufficient. It is strongly recommended to anchor patterns to the start (`^`), to the end (`$`) or both. Path separators (`'` for Windows and `/` on other systems) in paths are always normalized to a forward slash (`/`) before applying a pattern. The regular expression syntax is described in the [Python documentation for the `re` module](#).

Prefix path, selector *pp*:

This pattern style is useful to match whole sub-directories. The pattern `pp:/data/bar` matches `/data/bar` and everything therein.

Exclusions can be passed via the command line option `-exclude`. When used from within a shell the patterns should be quoted to protect them from expansion.

The `-exclude-from` option permits loading exclusion patterns from a text file with one pattern per line. Lines empty or starting with the number sign (`#`) after removing whitespace on both ends are ignored. The optional style selector prefix is also supported for patterns loaded from a file. Due to whitespace removal paths with whitespace at the beginning or end can only be excluded using regular expressions.

Examples:

```
# Exclude '/home/user/file.o' but not '/home/user/file.odt': $ borg create -e '*.o' backup /
# Exclude '/home/user/junk' and '/home/user/subdir/junk' but # not '/home/user/importantjunk' or '/etc/junk': $ borg
create -e '/home/*/junk' backup /
# Exclude the contents of '/home/user/cache' but not the directory itself: $ borg create -e /home/user/cache/ backup /
# The file '/home/user/cache/important' is not backed up: $ borg create -e /home/user/cache/ backup /
/home/user/cache/important
# The contents of directories in '/home' are not backed up when their name # ends in '.tmp' $ borg create --exclude
're:^(home/[^/]+.tmp)' backup /
# Load exclusions from file $ cat >exclude.txt <<EOF # Comment line /home/junk *.tmp fm:aa:something/
re:^(home/[^/].tmp/ sh:/home/*/thumbnails EOF $ borg create --exclude-from exclude.txt backup /
```

Debug Commands

There are some more commands (all starting with “debug-”) which are all **not intended for normal use** and **potentially very dangerous** if used incorrectly.

They exist to improve debugging capabilities without direct system access, e.g. in case you ever run into some severe malfunction. Use them only if you know what you are doing or if a trusted Borg developer tells you what to do.

Additional Notes

Here are misc. notes about topics that are maybe not covered in enough detail in the usage section.

Item flags `borg create -v --list` outputs a verbose list of all files, directories and other file system items it considered (no matter whether they had content changes or not). For each item, it prefixes a single-letter flag that indicates type and/or status of the item.

If you are interested only in a subset of that output, you can give e.g. `--filter=AME` and it will only show regular files with A, M or E status (see below).

A uppercase character represents the status of a regular file relative to the “files” cache (not relative to the repo – this is an issue if the files cache is not used). Metadata is stored in any case and for ‘A’ and ‘M’ also new data chunks are stored. For ‘U’ all data chunks refer to already existing chunks.

- ‘A’ = regular file, added (see also *I am seeing ‘A’ (added) status for a unchanged file!?* in the FAQ)
- ‘M’ = regular file, modified
- ‘U’ = regular file, unchanged
- ‘E’ = regular file, an error happened while accessing/reading *this* file

A lowercase character means a file type other than a regular file, borg usually just stores their metadata:

- ‘d’ = directory
- ‘b’ = block device
- ‘c’ = char device
- ‘h’ = regular file, hardlink (to already seen inodes)
- ‘s’ = symlink
- ‘f’ = fifo

Other flags used include:

- ‘i’ = backup data was read from standard input (stdin)
- ‘-’ = dry run, item was *not* backed up
- ‘?’ = missing status code (if you see this, please file a bug report!)

–chunker-params The chunker params influence how input files are cut into pieces (chunks) which are then considered for deduplication. They also have a big impact on resource usage (RAM and disk space) as the amount of resources needed is (also) determined by the total amount of chunks in the repository (see *Indexes / Caches memory usage* for details).

`--chunker-params=10,23,16,4095` results in a fine-grained deduplication and creates a big amount of chunks and thus uses a lot of resources to manage them. This is good for relatively small data volumes and if the machine has a good amount of free RAM and disk space.

`--chunker-params=19,23,21,4095` (default) results in a coarse-grained deduplication and creates a much smaller amount of chunks and thus uses less resources. This is good for relatively big data volumes and if the machine has a relatively low amount of free RAM and disk space.

If you already have made some archives in a repository and you then change chunker params, this of course impacts deduplication as the chunks will be cut differently.

In the worst case (all files are big and were touched in between backups), this will store all content into the repository again.

Usually, it is not that bad though:

- usually most files are not touched, so it will just re-use the old chunks it already has in the repo

- files smaller than the (both old and new) minimum chunksize result in only one chunk anyway, so the resulting chunks are same and deduplication will apply

If you switch chunker params to save resources for an existing repo that already has some backup archives, you will see an increasing effect over time, when more and more files have been touched and stored again using the bigger chunksize **and** all references to the smaller older chunks have been removed (by deleting / pruning archives).

If you want to see an immediate big effect on resource usage, you better start a new repository when changing chunker params.

For more details, see *Chunks*.

--read-special The option `--read-special` is not intended for normal, filesystem-level (full or partly-recursive) backups. You only give this option if you want to do something rather ... special – and if you have hand-picked some files that you want to treat that way.

`borg create --read-special` will open all files without doing any special treatment according to the file type (the only exception here are directories: they will be recursed into). Just imagine what happens if you do `cat filename` — the content you will see there is what borg will backup for that filename.

So, for example, symlinks will be followed, block device content will be read, named pipes / UNIX domain sockets will be read.

You need to be careful with what you give as filename when using `--read-special`, e.g. if you give `/dev/zero`, your backup will never terminate.

The given files' metadata is saved as it would be saved without `--read-special` (e.g. its name, its size [might be 0], its mode, etc.) – but additionally, also the content read from it will be saved for it.

Restoring such files' content is currently only supported one at a time via `--stdout` option (and you have to redirect stdout to where ever it shall go, maybe directly into an existing device file of your choice or indirectly via `dd`).

Example Imagine you have made some snapshots of logical volumes (LVs) you want to backup.

Note: For some scenarios, this is a good method to get “crash-like” consistency (I call it crash-like because it is the same as you would get if you just hit the reset button or your machine would abruptly and completely crash). This is better than no consistency at all and a good method for some use cases, but likely not good enough if you have databases running.

Then you create a backup archive of all these snapshots. The backup process will see a “frozen” state of the logical volumes, while the processes working in the original volumes continue changing the data stored there.

You also add the output of `lvdisplay` to your backup, so you can see the LV sizes in case you ever need to recreate and restore them.

After the backup has completed, you remove the snapshots again.

```
$ # create snapshots here
$ lvdisplay > lvdisplay.txt
$ borg create --read-special /mnt/backup::repo lvdisplay.txt /dev/vg0/*-snapshot
$ # remove snapshots here
```

Now, let's see how to restore some LVs from such a backup.

```
$ borg extract /mnt/backup::repo lvdisplay.txt
$ # create empty LVs with correct sizes here (look into lvdisplay.txt).
$ # we assume that you created an empty root and home LV and overwrite it now:
```

```
$ borg extract --stdout /mnt/backup::repo dev/vg0/root-snapshot > /dev/vg0/root
$ borg extract --stdout /mnt/backup::repo dev/vg0/home-snapshot > /dev/vg0/home
```

Append-only mode A repository can be made “append-only”, which means that Borg will never overwrite or delete committed data. This is useful for scenarios where multiple machines back up to a central backup server using `borg serve`, since a hacked machine cannot delete backups permanently.

To activate append-only mode, edit the repository config file and add a line `append_only=1` to the `[repository]` section (or edit the line if it exists).

In append-only mode Borg will create a transaction log in the `transactions` file, where each line is a transaction and a UTC timestamp.

Example Suppose an attacker remotely deleted all backups, but your repository was in append-only mode. A transaction log in this situation might look like this:

```
transaction 1, UTC time 2016-03-31T15:53:27.383532
transaction 5, UTC time 2016-03-31T15:53:52.588922
transaction 11, UTC time 2016-03-31T15:54:23.887256
transaction 12, UTC time 2016-03-31T15:55:54.022540
transaction 13, UTC time 2016-03-31T15:55:55.472564
```

From your security logs you conclude the attacker gained access at 15:54:00 and all the backups were deleted or replaced by compromised backups. From the log you know that transactions 11 and later are compromised. Note that the transaction ID is the name of the *last* file in the transaction. For example, transaction 11 spans files 6 to 11.

In a real attack you’ll likely want to keep the compromised repository intact to analyze what the attacker tried to achieve. It’s also a good idea to make this copy just in case something goes wrong during the recovery. Since recovery is done by deleting some files, a hard link copy (`cp -al`) is sufficient.

The first step to reset the repository to transaction 5, the last uncompromised transaction, is to remove the `hints.N` and `index.N` files in the repository (these two files are always expendable). In this example N is 13.

Then remove or move all segment files from the segment directories in `data/` starting with file 6:

```
rm data/**/{6..13}
```

That’s all to it.

Drawbacks As data is only appended, and nothing deleted, commands like `prune` or `delete` won’t free disk space, they merely tag data as deleted in a new transaction.

Note that you can go back-and-forth between normal and append-only operation by editing the configuration file, it’s not a “one way trip”.

Further considerations Append-only mode is not respected by tools other than Borg. `rm` still works on the repository. Make sure that backup client machines only get to access the repository via `borg serve`.

Ensure that no remote access is possible if the repository is temporarily set to normal mode for e.g. regular pruning.

Further protections can be implemented, but are outside of Borg’s scope. For example, file system snapshots or wrapping `borg serve` to set special permissions or ACLs on new data files.

Deployment

This chapter will give an example how to setup a borg repository server for multiple clients.

Machines

There are multiple machines used in this chapter and will further be named by their respective fully qualified domain name (fqdn).

- The backup server: *backup01.srv.local*
- The clients:
 - John Doe’s desktop: *johndoe.clnt.local*
 - Webservers 01: *web01.srv.local*
 - Application server 01: *app01.srv.local*

User and group

The repository server needs to have only one UNIX user for all the clients. Recommended user and group with additional settings:

- User: *backup*
- Group: *backup*
- Shell: */bin/bash* (or other capable to run the *borg serve* command)
- Home: */home/backup*

Most clients shall initiate a backup from the root user to catch all users, groups and permissions (e.g. when backing up */home*).

Folders

The following folder tree layout is suggested on the repository server:

- User home directory, */home/backup*
- Repositories path (storage pool): */home/backup/repos*
- Clients restricted paths (*/home/backup/repos/<client fqdn>*):
 - *johndoe.clnt.local*: */home/backup/repos/johndoe.clnt.local*
 - *web01.srv.local*: */home/backup/repos/web01.srv.local*
 - *app01.srv.local*: */home/backup/repos/app01.srv.local*

Restrictions

Borg is instructed to restrict clients into their own paths: `borg serve --restrict-to-path /home/backup/repos/<client fqdn>`

There is only one ssh key per client allowed. Keys are added for *johndoe.clnt.local*, *web01.srv.local* and *app01.srv.local*. But they will access the backup under only one UNIX user account as: *backup@backup01.srv.local*. Every key in *\$HOME/.ssh/authorized_keys* has a forced command and restrictions applied as shown below:

```
command="cd /home/backup/repos/<client fqdn>;
    borg serve --restrict-to-path /home/backup/repos/<client fqdn>",
    no-port-forwarding,no-X11-forwarding,no-pty,
    no-agent-forwarding,no-user-rc <keytype> <key> <host>
```

Note: The text shown above needs to be written on a single line!

The options which are added to the key will perform the following:

1. Change working directory
2. Run `borg serve` restricted to the client base path
3. Restrict ssh and do not allow stuff which imposes a security risk

Due to the `cd` command we use, the server automatically changes the current working directory. Then client doesn't need to have knowledge of the absolute or relative remote repository path and can directly access the repositories at `<user>@<host>:<repo>`.

Note: The setup above ignores all client given commandline parameters which are normally appended to the `borg serve` command.

Client

The client needs to initialize the `pictures` repository like this:

```
borg init backup@backup01.srv.local:pictures
```

Or with the full path (should actually never be used, as only for demonstrational purposes). The server should automatically change the current working directory to the `<client fqdn>` folder.

```
borg init backup@backup01.srv.local:/home/backup/repos/johndoe.cln.local/pictures
```

When `johndoe.cln.local` tries to access a not restricted path the following error is raised. John Doe tries to backup into the Web 01 path:

```
borg init backup@backup01.srv.local:/home/backup/repos/web01.srv.local/pictures
```

```
~~~ SNIP ~~~
Remote: borg.remote.PathNotAllowed: /home/backup/repos/web01.srv.local/pictures
~~~ SNIP ~~~
Repository path not allowed
```

Ansible

Ansible takes care of all the system-specific commands to add the user, create the folder. Even when the configuration is changed the repository server configuration is satisfied and reproducible.

Automate setting up an repository server with the user, group, folders and permissions a Ansible playbook could be used. Keep in mind the playbook uses the Arch Linux `pacman` package manager to install and keep borg up-to-date.

```
- hosts: backup01.srv.local
  vars:
    user: backup
    group: backup
```

```

home: /home/backup
pool: "{{ home }}/repos"
auth_users:
  - host: johndoe.clnt.local
    key: "{{ lookup('file', '/path/to/keys/johndoe.clnt.local.pub') }}"
  - host: web01.clnt.local
    key: "{{ lookup('file', '/path/to/keys/web01.clnt.local.pub') }}"
  - host: app01.clnt.local
    key: "{{ lookup('file', '/path/to/keys/app01.clnt.local.pub') }}"
tasks:
- pacman: name=borg state=latest update_cache=yes
- group: name="{{ group }}" state=present
- user: name="{{ user }}" shell=/bin/bash home="{{ home }}" createhome=yes group="{{ group }}" group="{{ group }}"
- file: path="{{ home }}" owner="{{ user }}" group="{{ group }}" mode=0700 state=directory
- file: path="{{ home }}/.ssh" owner="{{ user }}" group="{{ group }}" mode=0700 state=directory
- file: path="{{ pool }}" owner="{{ user }}" group="{{ group }}" mode=0700 state=directory
- authorized_key: user="{{ user }}"
                    key="{{ item.key }}"
                    key_options='command="cd {{ pool }}/{{ item.host }};borg serve --restrict-to-path={{ pool }}'
with_items: auth_users
- file: path="{{ home }}/.ssh/authorized_keys" owner="{{ user }}" group="{{ group }}" mode=0600 state=directory
- file: path="{{ pool }}/{{ item.host }}" owner="{{ user }}" group="{{ group }}" mode=0700 state=directory
with_items: auth_users

```

Enhancements

As this chapter only describes a simple and effective setup it could be further enhanced when supporting (a limited set) of client supplied commands. A wrapper for starting *borg serve* could be written. Or borg itself could be enhanced to autodetect it runs under SSH by checking the `SSH_ORIGINAL_COMMAND` environment variable. This is left open for future improvements.

When extending ssh autodetection in borg no external wrapper script is necessary and no other interpreter or application has to be deployed.

Frequently asked questions

Can I backup VM disk images?

Yes, the [deduplication](#) technique used by Borg makes sure only the modified parts of the file are stored. Also, we have optional simple sparse file support for extract.

Can I backup from multiple servers into a single repository?

Yes, but in order for the deduplication used by Borg to work, it needs to keep a local cache containing checksums of all file chunks already stored in the repository. This cache is stored in `~/.cache/borg/`. If Borg detects that a

repository has been modified since the local cache was updated it will need to rebuild the cache. This rebuild can be quite time consuming.

So, yes it's possible. But it will be most efficient if a single repository is only modified from one place. Also keep in mind that Borg will keep an exclusive lock on the repository while creating or deleting archives, which may make *simultaneous* backups fail.

Can I copy or synchronize my repo to another location?

Yes, you could just copy all the files. Make sure you do that while no backup is running. So what you get here is this:

- client machine —borg create—> repo1
- repo1 —copy—> repo2

There is no special borg command to do the copying, just use cp or rsync if you want to do that.

But think about whether that is really what you want. If something goes wrong in repo1, you will have the same issue in repo2 after the copy.

If you want to have 2 independent backups, it is better to do it like this:

- client machine —borg create—> repo1
- client machine —borg create—> repo2

Which file types, attributes, etc. are preserved?

- Directories
- Regular files
- Hardlinks (considering all files in the same archive)
- Symlinks (stored as symlink, the symlink is not followed)
- Character and block device files
- FIFOs (“named pipes”)
- Name
- Contents
- Timestamps in nanosecond precision: mtime, atime, ctime
- IDs of owning user and owning group
- Names of owning user and owning group (if the IDs can be resolved)
- Unix Mode/Permissions (u/g/o permissions, suid, sgid, sticky)
- Extended Attributes (xattrs) on Linux, OS X and FreeBSD
- Access Control Lists (ACL) on Linux, OS X and FreeBSD
- BSD flags on OS X and FreeBSD

Which file types, attributes, etc. are *not* preserved?

- UNIX domain sockets (because it does not make sense - they are meaningless without the running process that created them and the process needs to recreate them in any case). So, don't panic if your backup misses a UDS!
- The precise on-disk (or rather: not-on-disk) representation of the holes in a sparse file. Archive creation has no special support for sparse files, holes are backed up as (deduplicated and compressed) runs of zero bytes. Archive extraction has optional support to extract all-zero chunks as holes in a sparse file.
- filesystem specific attributes, like ext4 immutable bit, see #618.

Why is my backup bigger than with attic? Why doesn't Borg do compression by default?

Attic was rather unflexible when it comes to compression, it always compressed using zlib level 6 (no way to switch compression off or adjust the level or algorithm).

Borg offers a lot of different compression algorithms and levels. Which of them is the best for you pretty much depends on your use case, your data, your hardware – so you need to do an informed decision about whether you want to use compression, which algorithm and which level you want to use. This is why compression defaults to none.

How can I specify the encryption passphrase programmatically?

The encryption passphrase can be specified programmatically using the `BORG_PASSPHRASE` environment variable. This is convenient when setting up automated encrypted backups. Another option is to use key file based encryption with a blank passphrase. See *Repository encryption* for more details.

Note: Be careful how you set the environment; using the `env` command, a `system()` call or using inline shell scripts might expose the credentials in the process list directly and they will be readable to all users on a system. Using `export` in a shell script file should be safe, however, as the environment of a process is *accessible only to that user*.

When backing up to remote encrypted repos, is encryption done locally?

Yes, file and directory metadata and data is locally encrypted, before leaving the local machine. We do not mean the transport layer encryption by that, but the data/metadata itself. Transport layer encryption (e.g. when ssh is used as a transport) applies additionally.

When backing up to remote servers, do I have to trust the remote server?

Yes and No.

No, as far as data confidentiality is concerned - if you use encryption, all your files/dirs data and metadata are stored in their encrypted form into the repository.

Yes, as an attacker with access to the remote server could delete (or otherwise make unavailable) all your backups.

Why do I get “connection closed by remote” after a while?

When doing a backup to a remote server (using a ssh: repo URL), it sometimes stops after a while (some minutes, hours, ... - not immediately) with “connection closed by remote” error message. Why?

That's a good question and we are trying to find a good answer in [ticket 636](#).

The borg cache eats way too much disk space, what can I do?

There is a temporary (but maybe long lived) hack to avoid using lots of disk space for `chunks.archive.d` (see [#235](#) for details):

```
# this assumes you are working with the same user as the backup.
# you can get the REPOID from the "config" file inside the repository.
cd ~/.cache/borg/<REPOID>
rm -rf chunks.archive.d ; touch chunks.archive.d
```

This deletes all the cached archive chunk indexes and replaces the directory that kept them with a file, so borg won't be able to store anything "in" there in future.

This has some pros and cons, though:

- much less disk space needs for `~/.cache/borg`.
- chunk cache resyncs will be slower as it will have to transfer chunk usage metadata for all archives from the repository (which might be slow if your repo connection is slow) and it will also have to build the hashtables from that data. chunk cache resyncs happen e.g. if your repo was written to by another machine (if you share same backup repo between multiple machines) or if your local chunks cache was lost somehow.

The long term plan to improve this is called "borgception", see [#474](#).

If a backup stops mid-way, does the already-backed-up data stay there?

Yes, Borg supports resuming backups.

During a backup a special checkpoint archive named `<archive-name>.checkpoint` is saved every checkpoint interval (the default value for this is 5 minutes) containing all the data backed-up until that point. This means that at most `<checkpoint interval>` worth of data needs to be retransmitted if a backup needs to be restarted.

Once your backup has finished successfully, you can delete all `<archive-name>.checkpoint` archives.

If it crashes with a UnicodeError, what can I do?

Check if your encoding is set correctly. For most POSIX-like systems, try:

```
export LANG=en_US.UTF-8 # or similar, important is correct charset
```

I can't extract non-ascii filenames by giving them on the commandline!?

This might be due to different ways to represent some characters in unicode or due to other non-ascii encoding issues.

If you run into that, try this:

- avoid the non-ascii characters on the commandline by e.g. extracting the parent directory (or even everything)
- mount the repo using FUSE and use some file manager

Can Borg add redundancy to the backup data to deal with hardware malfunction?

No, it can't. While that at first sounds like a good idea to defend against some defect HDD sectors or SSD flash blocks, dealing with this in a reliable way needs a lot of low-level storage layout information and control which we do not have (and also can't get, even if we wanted).

So, if you need that, consider RAID or a filesystem that offers redundant storage or just make backups to different locations / different hardware.

See also [ticket 225](#).

Can Borg verify data integrity of a backup archive?

Yes, if you want to detect accidental data damage (like bit rot), use the `check` operation. It will notice corruption using CRCs and hashes. If you want to be able to detect malicious tampering also, use an encrypted repo. It will then be able to check using CRCs and HMACs.

I am seeing 'A' (added) status for a unchanged file!?

The files cache is used to determine whether Borg already “knows” / has backed up a file and if so, to skip the file from chunking. It does intentionally *not* contain files that:

- have ≥ 10 as “entry age” (Borg has not seen this file for a while)
- have a modification time (mtime) same as the newest mtime in the created archive

So, if you see an ‘A’ status for unchanged file(s), they are likely the files with the most recent mtime in that archive.

This is expected: it is to avoid data loss with files that are backed up from a snapshot and that are immediately changed after the snapshot (but within mtime granularity time, so the mtime would not change). Without the code that removes these files from the files cache, the change that happened right after the snapshot would not be contained in the next backup as Borg would think the file is unchanged.

This does not affect deduplication, the file will be chunked, but as the chunks will often be the same and already stored in the repo (except in the above mentioned rare condition), it will just re-use them as usual and not store new data chunks.

If you want to avoid unnecessary chunking, just create or touch a small or empty file in your backup source file set (so that one has the latest mtime, not your 50GB VM disk image) and, if you do snapshots, do the snapshot after that.

Since only the files cache is used in the display of files status, those files are reported as being added when, really, chunks are already used.

Is there a way to limit bandwidth with Borg?

There is no command line option to limit bandwidth with Borg, but bandwidth limiting can be accomplished with `pipeviewer`:

Create a wrapper script: `/usr/local/bin/pv-wrapper`

```
#!/bin/bash
  ## -q, --quiet           do not output any transfer information at all
  ## -L, --rate-limit RATE limit transfer to RATE bytes per second
export RATE=307200
pv -q -L $RATE | "$@"
```

Add `BORG_RSH` environment variable to use `pipeviewer` wrapper script with `ssh`.

```
export BORG_RSH='/usr/local/bin/pv-wrapper.sh ssh'
```

Now Borg will be bandwidth limited. Nice thing about `pv` is that you can change rate-limit on the fly:

```
pv -R $(pidof pv) -L 102400
```

I am having troubles with some network/FUSE/special filesystem, why?

Borg is doing nothing special in the filesystem, it only uses very common and compatible operations (even the locking is just “mkdir”).

So, if you are encountering issues like slowness, corruption or malfunction when using a specific filesystem, please try if you can reproduce the issues with a local (non-network) and proven filesystem (like ext4 on Linux).

If you can't reproduce the issue then, you maybe have found an issue within the filesystem code you used (not with Borg). For this case, it is recommended that you talk to the developers / support of the network fs and maybe open an issue in their issue tracker. Do not file an issue in the Borg issue tracker.

If you can reproduce the issue with the proven filesystem, please file an issue in the Borg issue tracker about that.

Why was Borg forked from Attic?

Borg was created in May 2015 in response to the difficulty of getting new code or larger changes incorporated into Attic and establishing a bigger developer community / more open development.

More details can be found in [ticket 217](#) that led to the fork.

Borg intends to be:

- simple:
 - as simple as possible, but no simpler
 - do the right thing by default, but offer options
- open:
 - welcome feature requests
 - accept pull requests of good quality and coding style
 - give feedback on PRs that can't be accepted “as is”
 - discuss openly, don't work in the dark
- changing:
 - Borg is not compatible with Attic
 - do not break compatibility accidentally, without a good reason or without warning. allow compatibility breaking for other cases.
 - if major version number changes, it may have incompatible changes

Support

Please first read the docs, the existing issue tracker issues and mailing list posts – a lot of stuff is already documented / explained / discussed / filed there.

Issue Tracker

If you've found a bug or have a concrete feature request, please create a new ticket on the project's [issue tracker](#).

For more general questions or discussions, IRC or mailing list are preferred.

IRC

Join us on channel #borgbackup on chat.freenode.net.

As usual on IRC, just ask or tell directly and then patiently wait for replies. Stay connected.

Mailing list

To find out about the mailing list, its topic, how to subscribe, how to unsubscribe and where you can find the archives of the list, see the [mailing list homepage](#).

Bounties and Fundraisers

We use [BountySource](#) to allow monetary contributions to the project and the developers, who push it forward.

There, you can give general funds to the borgbackup members (the developers will then spend the funds as they deem fit). If you do not have some specific bounty (see below), you can use this as a general way to say "Thank You!" and support the software / project you like.

If you want to encourage developers to fix some specific issue or implement some specific feature suggestion, you can post a new bounty or back an existing one (they always refer to an issue in our [issue tracker](#)).

As a developer, you can become a Bounty Hunter and win bounties (earn money) by contributing to Borg, a free and open source software project.

We might also use BountySource to fund raise for some bigger goals.

Resources

This is a collection of additional resources that are somehow related to borgbackup.

Videos, Talks, Presentations

Some of them refer to attic, but you can do the same stuff (and more) with borgbackup.

- [BorgBackup Installation and Basic Usage](#) (english screencast)
- [TW's slides for borgbackup talks / lightning talks](#) (just grab the latest ones)
- "Attic / Borg Backup" talk from GPN 2015 (video, german audio, english slides): [media.ccc.de](#) or [youtube](#)
- "Attic" talk from Easterhegg 2015 (video, german audio, english slides): [media.ccc.de](#) or [youtube](#)
- "Attic Backup: Mount your encrypted backups over ssh", 2014 (video, english): [youtube](#)
- "Evolution of Borg", Oct 2015 (gource visualization of attic and borg development): [youtube](#)

Software

- [BorgWeb](#) - a very simple web UI for BorgBackup
- some other stuff found at the [BorgBackup Github](#) organisation
- [atticmatic](#) (includes borgmatic)

Changelog

Version 1.0.1

New features:

Usually there are no new features in a bugfix release, but these were added due to their high impact on security/safety/speed or because they are fixes also:

- append-only mode for repositories, #809, #36 (see docs)
- borg create: add `--ignore-inode` option to make borg detect unmodified files even if your filesystem does not have stable inode numbers (like sshfs and possibly CIFS).
- add options `--warning`, `--error`, `--critical` for missing log levels, #826. it's not recommended to suppress warnings or errors, but the user may decide this on his own. note: `--warning` is not given to borg serve so a `<= 1.0.0` borg will still work as server (it is not needed as it is the default). do not use `--error` or `--critical` when using a `<= 1.0.0` borg server.

Bug fixes:

- fix silently skipping EIO, #748
- add context manager for Repository (avoid orphan repository locks), #285
- do not sleep for >60s while waiting for lock, #773
- unpack file stats before passing to FUSE
- fix build on illumos
- don't try to backup doors or event ports (Solaris and derivatives)
- remove useless/misleading libc version display, #738
- test suite: reset exit code of persistent archiver, #844
- RemoteRepository: clean up pipe if remote open() fails
- Remote: don't print tracebacks for Error exceptions handled downstream, #792
- if BORG_PASSPHRASE is present but wrong, don't prompt for password, but fail instead, #791
- ArchiveChecker: move "orphaned objects check skipped" to INFO log level, #826
- fix capitalization, add ellipses, change log level to debug for 2 messages, #798

Other changes:

- update llfuse requirement, llfuse 1.0 works
- update OS / dist packages on build machines, #717
- prefer showing `--info` over `-v` in usage help, #859
- docs:

- fix cygwin requirements (gcc-g++)
- document how to debug / file filesystem issues, #664
- fix reproducible build of api docs
- RTD theme: CSS !important overwrite, #727
- Document logo font. Recreate logo png. Remove GIMP logo file.

Version 1.0.0

The major release number change (0.x -> 1.x) indicates bigger incompatible changes, please read the compatibility notes, adapt / test your scripts and check your backup logs.

Compatibility notes:

- drop support for python 3.2 and 3.3, require 3.4 or 3.5, #221 #65 #490 note: we provide binaries that include python 3.5.1 and everything else needed. they are an option in case you are stuck with < 3.4 otherwise.
- change encryption to be on by default (using “repokey” mode)
- moved keyfile keys from ~/.borg/keys to ~/.config/borg/keys, you can either move them manually or run “borg upgrade <REPO>”
- remove support for --encryption=passphrase, use borg migrate-to-repokey to switch to repokey mode, #97
- remove deprecated --compression <number>, use --compression zlib,<number> instead in case of 0, you could also use --compression none
- remove deprecated --hourly/daily/weekly/monthly/yearly use --keep-hourly/daily/weekly/monthly/yearly instead
- remove deprecated --do-not-cross-mountpoints, use --one-file-system instead
- disambiguate -p option, #563:
 - -p now is same as --progress
 - -P now is same as --prefix
- remove deprecated “borg verify”, use “borg extract --dry-run” instead
- cleanup environment variable semantics, #355 the environment variables used to be “yes sayers” when set, this was conceptually generalized to “automatic answerers” and they just give their value as answer (as if you typed in that value when being asked). See the “usage” / “Environment Variables” section of the docs for details.
- change the builtin default for --chunker-params, create 2MiB chunks, #343 --chunker-params new default: 19,23,21,4095 - old default: 10,23,16,4095

one of the biggest issues with borg < 1.0 (and also attic) was that it had a default target chunk size of 64kiB, thus it created a lot of chunks and thus also a huge chunk management overhead (high RAM and disk usage).

please note that the new default won’t change the chunks that you already have in your repository. the new big chunks do not deduplicate with the old small chunks, so expect your repo to grow at least by the size of every changed file and in the worst case (e.g. if your files cache was lost / is not used) by the size of every file (minus any compression you might use).

in case you want to immediately see a much lower resource usage (RAM / disk) for chunks management, it might be better to start with a new repo than continuing in the existing repo (with an existing repo, you’d have to wait until all archives with small chunks got pruned to see a lower resource usage).

if you used the old `--chunker-params` default value (or if you did not use `--chunker-params` option at all) and you'd like to continue using small chunks (and you accept the huge resource usage that comes with that), just explicitly use `borg create --chunker-params=10,23,16,4095`.

- archive timestamps: the 'time' timestamp now refers to archive creation start time (was: end time), the new 'time_end' timestamp refers to archive creation end time. This might affect prune if your backups take rather long. if you give a timestamp via cli this is stored into 'time', therefore it now needs to mean archive creation start time.

New features:

- implement password roundtrip, #695

Bug fixes:

- remote end does not need cache nor keys directories, do not create them, #701
- added retry counter for passwords, #703

Other changes:

- fix compiler warnings, #697
- docs:
 - update README.rst to new changelog location in docs/changes.rst
 - add Teemu to AUTHORS
 - changes.rst: fix old chunker params, #698
 - FAQ: how to limit bandwidth

Version 1.0.0rc2

New features:

- format options for location: user, pid, fqdn, hostname, now, utcnow, user
- `borg list --list-format`
- `borg prune -v --list` enables the keep/prune list output, #658

Bug fixes:

- fix `_open_rb` noatime handling, #657
- add a simple archivername validator, #680
- `borg create --stats`: show timestamps in localtime, use same labels/formatting as `borg info`, #651
- llfuse compatibility fixes (now compatible with: 0.40, 0.41, 0.42)

Other changes:

- it is now possible to use "`pip install borgbackup[fuse]`" to automatically install the llfuse dependency using the correct version requirement for it. you still need to care about having installed the FUSE / build related OS package first, though, so that building llfuse can succeed.
- Vagrant: drop Ubuntu Precise (12.04) - does not have Python ≥ 3.4
- Vagrant: use pyinstaller v3.1.1 to build binaries
- docs:
 - `borg upgrade`: add to docs that only LOCAL repos are supported

- borg upgrade also handles borg 0.xx -> 1.0
- use pip extras or requirements file to install llfuse
- fix order in release process
- updated usage docs and other minor / cosmetic fixes
- verified borg examples in docs, #644
- freebsd dependency installation and fuse configuration, #649
- add example how to restore a raw device, #671
- add a hint about the dev headers needed when installing from source
- add examples for delete (and handle delete after list, before prune), #656
- update example for borg create -v -stats (use iso datetime format), #663
- added example to BORG_RSH docs
- “connection closed by remote”: add FAQ entry and point to issue #636

Version 1.0.0rc1

New features:

- borg migrate-to-repokey (“passphrase” -> “repokey” encryption key mode)
- implement -short for borg list REPO, #611
- implement -list for borg extract (consistency with borg create)
- borg serve: overwrite client’s -restrict-to-path with ssh forced command’s option value (but keep everything else from the client commandline), #544
- use \$XDG_CONFIG_HOME/keys for keyfile keys (~/.config/borg/keys), #515
- “borg upgrade” moves the keyfile keys to the new location
- display both archive creation start and end time in “borg info”, #627

Bug fixes:

- normalize trailing slashes for the repository path, #606
- Cache: fix exception handling in __init__, release lock, #610

Other changes:

- suppress unneeded exception context (PEP 409), simpler tracebacks
- removed special code needed to deal with imperfections / incompatibilities / missing stuff in py 3.2/3.3, simplify code that can be done simpler in 3.4
- removed some version requirements that were kept on old versions because newer did not support py 3.2 any more
- use some py 3.4+ stdlib code instead of own/openssl/pypi code:
 - use os.urandom instead of own cython openssl RAND_bytes wrapper, #493
 - use hashlib.pbkdf2_hmac from py stdlib instead of own openssl wrapper
 - use hmac.compare_digest instead of == operator (constant time comparison)
 - use stat.filemode instead of homegrown code

- use “mock” library from stdlib, #145
- remove borg.support (with non-broken argparse copy), it is ok in 3.4+, #358
- Vagrant: copy CHANGES.rst as symlink, #592
- cosmetic code cleanups, add flake8 to tox/travis, #4
- docs / help:
 - make “borg -h” output prettier, #591
 - slightly rephrase prune help
 - add missing example for –list option of borg create
 - quote exclude line that includes an asterisk to prevent shell expansion
 - fix dead link to license
 - delete Ubuntu Vivid, it is not supported anymore (EOL)
 - OS X binary does not work for older OS X releases, #629
 - borg serve’s special support for forced/original ssh commands, #544
 - misc. updates and fixes

Version 0.30.0

Compatibility notes:

- you may need to use `-v` (or `-info`) more often to actually see output emitted at INFO log level (because it is suppressed at the default WARNING log level). See the “general” section in the usage docs.
- for borg create, you need `-list` (additionally to `-v`) to see the long file list (was needed so you can have e.g. `-stats` alone without the long list)
- see `BORG_DELETE_I_KNOW_WHAT_I_AM_DOING` below about `BORG_DELETE_I_KNOW_WHAT_I_AM_DOING` (was: `BORG_CHECK_I_KNOW_WHAT_I_AM_DOING`)

Bug fixes:

- fix crash when using borg create `-dry-run -keep-tag-files`, #570
- make sure teardown with cleanup happens for Cache and RepositoryCache, avoiding leftover locks and TEMP dir contents, #285 (partially), #548
- fix locking KeyError, partial fix for #502
- log stats consistently, #526
- add abbreviated weekday to timestamp format, fixes #496
- strip whitespace when loading exclusions from file
- unset `LD_LIBRARY_PATH` before invoking ssh, fixes strange OpenSSL library version warning when using the borg binary, #514
- add some error handling/fallback for C library loading, #494
- added `BORG_DELETE_I_KNOW_WHAT_I_AM_DOING` for check in “borg delete”, #503
- remove unused “repair” rpc method name

New features:

- borg create: implement exclusions using regular expression patterns.
- borg create: implement inclusions using patterns.
- borg extract: support patterns, #361
- support different styles for patterns:
 - fnmatch (*fm*: prefix, default when omitted), like borg <= 0.29.
 - shell (*sh*: prefix) with * not matching directory separators and **/ matching 0..n directories
 - path prefix (*pp*: prefix, for unifying borg create pp1 pp2 into the patterns system), semantics like in borg <= 0.29
 - regular expression (*re*:), new!
- –progress option for borg upgrade (#291) and borg delete <archive>
- update progress indication more often (e.g. for borg create within big files or for borg check repo), #500
- finer chunker granularity for items metadata stream, #547, #487
- borg create –list now used (additionally to -v) to enable the verbose file list output
- display borg version below tracebacks, #532

Other changes:

- hashtable size (and thus: RAM and disk consumption) follows a growth policy: grows fast while small, grows slower when getting bigger, #527
- Vagrantfile: use pyinstaller 3.1 to build binaries, freebsd sqlite3 fix, fixes #569
- no separate binaries for centos6 any more because the generic linux binaries also work on centos6 (or in general: on systems with a slightly older glibc than debian7)
- dev environment: require virtualenv<14.0 so we get a py32 compatible pip
- docs:
 - add space-saving chunks.archive.d trick to FAQ
 - important: clarify -v and log levels in usage -> general, please read!
 - sphinx configuration: create a simple man page from usage docs
 - add a repo server setup example
 - disable unneeded SSH features in authorized_keys examples for security.
 - borg prune only knows “–keep-within” and not “–within”
 - add gource video to resources docs, #507
 - add netbsd install instructions
 - authors: make it more clear what refers to borg and what to attic
 - document standalone binary requirements, #499
 - rephrase the mailing list section
 - development docs: run build_api and build_usage before tagging release
 - internals docs: hash table max. load factor is 0.75 now
 - markup, typo, grammar, phrasing, clarifications and other fixes.
 - add gcc gcc-c++ to redhat/fedora/corora install docs, fixes #583

Version 0.29.0

Compatibility notes:

- when upgrading to 0.29.0 you need to upgrade client as well as server installations due to the locking and commandline interface changes otherwise you'll get an error msg about a RPC protocol mismatch or a wrong commandline option. if you run a server that needs to support both old and new clients, it is suggested that you have a "borg-0.28.2" and a "borg-0.29.0" command. clients then can choose via e.g. "borg --remote-path=borg-0.29.0 ...".
- the default waiting time for a lock changed from infinity to 1 second for a better interactive user experience. if the repo you want to access is currently locked, borg will now terminate after 1s with an error message. if you have scripts that shall wait for the lock for a longer time, use --lock-wait N (with N being the maximum wait time in seconds).

Bug fixes:

- hash table tuning (better chosen hashtable load factor 0.75 and prime initial size of 1031 gave ~1000x speedup in some scenarios)
- avoid creation of an orphan lock for one case, #285
- --keep-tag-files: fix file mode and multiple tag files in one directory, #432
- fixes for "borg upgrade" (attic repo converter), #466
- remove --progress isatty magic (and also --no-progress option) again, #476
- borg init: display proper repo URL
- fix format of umask in help pages, #463

New features:

- implement --lock-wait, support timeout for UpgradableLock, #210
- implement borg break-lock command, #157
- include system info below traceback, #324
- sane remote logging, remote stderr, #461:
 - remote log output: intercept it and log it via local logging system, with "Remote: " prefixed to message. log remote tracebacks.
 - remote stderr: output it to local stderr with "Remote: " prefixed.
- add --debug and --info (same as --verbose) to set the log level of the builtin logging configuration (which otherwise defaults to warning), #426 note: there are few messages emitted at DEBUG level currently.
- optionally configure logging via env var BORG_LOGGING_CONF
- add --filter option for status characters: e.g. to show only the added or modified files (and also errors), use "borg create -v --filter=AME ...".
- more progress indicators, #394
- use ISO-8601 date and time format, #375
- "borg check --prefix" to restrict archive checking to that name prefix, #206

Other changes:

- hashindex_add C implementation (speed up cache re-sync for new archives)
- increase FUSE read_size to 1024 (speed up metadata operations)

- check/delete/prune `--save-space`: free unused segments quickly, #239
- increase rpc protocol version to 2 (see also Compatibility notes), #458
- silence borg by default (via default log level WARNING)
- get rid of C compiler warnings, #391
- upgrade OS X FUSE to 3.0.9 on the OS X binary build system
- use python 3.5.1 to build binaries
- docs:
 - new mailing list borgbackup@python.org, #468
 - readthedocs: color and logo improvements
 - load coverage icons over SSL (avoids mixed content)
 - more precise binary installation steps
 - update release procedure docs about OS X FUSE
 - FAQ entry about unexpected ‘A’ status for unchanged file(s), #403
 - add docs about ‘E’ file status
 - add “borg upgrade” docs, #464
 - add developer docs about output and logging
 - clarify encryption, add note about client-side encryption
 - add resources section, with videos, talks, presentations, #149
 - Borg moved to Arch Linux [community]
 - fix wrong installation instructions for archlinux

Version 0.28.2

New features:

- borg create `--exclude-if-present TAGFILE` - exclude directories that have the given file from the backup. You can additionally give `--keep-tag-files` to preserve just the directory roots and the tag-files (but not backup other directory contents), #395, attic #128, attic #142

Other changes:

- do not create docs sources at build time (just have them in the repo), completely remove `have_cython()` hack, do not use the “mock” library at build time, #384
- avoid hidden import, make it easier for PyInstaller, easier fix for #218
- docs:
 - add description of item flags / status output, fixes #402
 - explain how to regenerate usage and API files (`build_api` or `build_usage`) and when to commit usage files directly into git, #384
 - minor install docs improvements

Version 0.28.1

Bug fixes:

- do not try to build api / usage docs for production install, fixes unexpected “mock” build dependency, #384

Other changes:

- avoid using msgpack.packb at import time
- fix formatting issue in changes.rst
- fix build on readthedocs

Version 0.28.0

Compatibility notes:

- changed return codes (exit codes), see docs. in short: old: 0 = ok, 1 = error. now: 0 = ok, 1 = warning, 2 = error

New features:

- refactor return codes (exit codes), fixes #61
- add `--show-rc` option enable “terminating with X status, rc N” output, fixes 58, #351
- borg create backups atime and ctime additionally to mtime, fixes #317 - extract: support atime additionally to mtime - FUSE: support ctime and atime additionally to mtime
- support borg `--version`
- emit a warning if we have a slow msgpack installed
- borg list `--prefix=thishostname- REPO`, fixes #205
- Debug commands (do not use except if you know what you do: debug-get-obj, debug-put-obj, debug-delete-obj, debug-dump-archive-items).

Bug fixes:

- setup.py: fix bug related to BORG_LZ4_PREFIX processing
- fix “check” for repos that have incomplete chunks, fixes #364
- borg mount: fix unlocking of repository at umount time, fixes #331
- fix reading files without touching their atime, #334
- non-ascii ACL fixes for Linux, FreeBSD and OS X, #277
- fix `acl_use_local_uid_gid()` and add a test for it, attic #359
- borg upgrade: do not upgrade repositories in place by default, #299
- fix cascading failure with the index conversion code, #269
- borg check: implement ‘cmdline’ archive metadata value decoding, #311
- fix RobustUnpacker, it missed some metadata keys (new atime and ctime keys were missing, but also bsdfags). add check for unknown metadata keys.
- create from stdin: also save atime, ctime (cosmetic)
- use `default_notty=False` for confirmations, fixes #345
- vagrant: fix msgpack installation on centos, fixes #342

- deal with unicode errors for symlinks in same way as for regular files and have a helpful warning message about how to fix wrong locale setup, fixes #382
- add ACL keys the RobustUnpacker must know about

Other changes:

- improve file size displays, more flexible size formatters
- explicitly commit to the units standard, #289
- archiver: add E status (means that an error occurred when processing this (single) item)
- do binary releases via “github releases”, closes #214
- create: use `-x` and `--one-file-system` (was: `--do-not-cross-mountpoints`), #296
- a lot of changes related to using “logging” module and screen output, #233
- show progress display if on a tty, output more progress information, #303
- factor out status output so it is consistent, fix surrogates removal, maybe fixes #309
- move away from RawConfigParser to ConfigParser
- archive checker: better error logging, give `chunk_id` and sequence numbers (can be used together with borg `debug-dump-archive-items`).
- do not mention the deprecated passphrase mode
- emit a deprecation warning for `--compression N` (giving a just a number)
- misc `.coveragerc` fixes (and coverage measurement improvements), fixes #319
- refactor confirmation code, reduce code duplication, add tests
- prettier error messages, fixes #307, #57
- tests:
 - add a test to find disk-full issues, #327
 - travis: also run tests on Python 3.5
 - travis: use `tox -r` so it rebuilds the tox environments
 - test the generated pyinstaller-based binary by archiver unit tests, #215
 - vagrant: tests: announce whether fakeroot is used or not
 - vagrant: add vagrant user to fuse group for debianoid systems also
 - vagrant: llfuse install on darwin needs `pkgconfig` installed
 - vagrant: use pyinstaller from develop branch, fixes #336
 - benchmarks: test create, extract, list, delete, info, check, help, fixes #146
 - benchmarks: test with both the binary and the python code
 - archiver tests: test with both the binary and the python code, fixes #215
 - make basic test more robust
- docs:
 - moved docs to `borgbackup.readthedocs.org`, #155
 - a lot of fixes and improvements, use mobile-friendly RTD standard theme
 - use `zlib,6` compression in some examples, fixes #275

- add missing rename usage to docs, closes #279
- include the help offered by `borg help <topic>` in the usage docs, fixes #293
- include a list of major changes compared to attic into README, fixes #224
- add OS X install instructions, #197
- more details about the release process, #260
- fix linux glibc requirement (binaries built on debian7 now)
- build: move usage and API generation to `setup.py`
- update docs about return codes, #61
- remove api docs (too much breakage on rtd)
- borgbackup install + basics presentation (asciinema)
- describe the current style guide in documentation
- add section about debug commands
- warn about not running out of space
- add example for rename
- improve chunker params docs, fixes #362
- minor development docs update

Version 0.27.0

New features:

- “borg upgrade” command - attic -> borg one time converter / migration, #21
- temporary hack to avoid using lots of disk space for `chunks.archive.d`, #235: To use it: `rm -rf chunks.archive.d ; touch chunks.archive.d`
- respect `XDG_CACHE_HOME`, attic #181
- add support for arbitrary SSH commands, attic #99
- borg delete `-cache-only REPO` (only delete cache, not REPO), attic #123

Bug fixes:

- use Debian 7 (wheezy) to build pyinstaller borgbackup binaries, fixes slow down observed when running the Centos6-built binary on Ubuntu, #222
- do not crash on empty `lock.roster`, fixes #232
- fix multiple issues with the cache config version check, #234
- fix segment entry header size check, attic #352 plus other error handling improvements / code deduplication there.
- always give segment and offset in repo `IntegrityErrors`

Other changes:

- stop producing binary wheels, remove docs about it, #147
- docs: - add warning about prune - generate usage include files only as needed - development docs: add Vagrant section - update / improve / reformat FAQ - hint to single-file pyinstaller binaries from README

Version 0.26.1

This is a minor update, just docs and new pyinstaller binaries.

- docs update about python and binary requirements
- better docs for `--read-special`, fix #220
- re-built the binaries, fix #218 and #213 (glibc version issue)
- update web site about single-file pyinstaller binaries

Note: if you did a python-based installation, there is no need to upgrade.

Version 0.26.0

New features:

- Faster cache sync (do all in one pass, remove tar/compression stuff), #163
- `BORG_REPO` env var to specify the default repo, #168
- read special files as if they were regular files, #79
- implement `borg create --dry-run`, attic issue #267
- Normalize paths before pattern matching on OS X, #143
- support OpenBSD and NetBSD (except xattrs/ACLs)
- support / run tests on Python 3.5

Bug fixes:

- `borg mount repo`: use absolute path, attic #200, attic #137
- `chunker`: use `off_t` to get 64bit on 32bit platform, #178
- initialize `chunker fd` to `-1`, so it's not equal to `STDIN_FILENO (0)`
- fix reaction to "no" answer at delete repo prompt, #182
- `setup.py`: detect `lz4.h` header file location
- to support python < 3.2.4, add less buggy `argparse` lib from 3.2.6 (#194)
- fix for obtaining `char *` from temporary Python value (old code causes a compile error on Mint 17.2)
- `llfuse 0.41` install troubles on some platforms, require < 0.41 (`UnicodeDecodeError` exception due to non-ascii `llfuse setup.py`)
- `cython` code: add some `int` types to get rid of unspecific python `add / subtract` operations (avoid `undefined symbol FPE_...` error on some platforms)
- fix verbose mode display of `stdin backup`
- `extract`: warn if a include pattern never matched, fixes #209, implement counters for `Include/ExcludePatterns`
- archive names with slashes are invalid, attic issue #180
- `chunker`: add a check whether the `POSIX_FADV_DONTNEED` constant is defined - fixes building on OpenBSD.

Other changes:

- detect inconsistency / corruption / hash collision, #170

- replace versioneer with setuptools_scm, #106
- docs:
 - pkg-config is needed for llfuse installation
 - be more clear about pruning, attic issue #132
- unit tests:
 - xattr: ignore security.selinux attribute showing up
 - ext3 seems to need a bit more space for a sparse file
 - do not test lzma level 9 compression (avoid MemoryError)
 - work around strange mtime granularity issue on netbsd, fixes #204
 - ignore st_rdev if file is not a block/char device, fixes #203
 - stay away from the setgid and sticky mode bits
- use Vagrant to do easy cross-platform testing (#196), currently:
 - Debian 7 “wheezy” 32bit, Debian 8 “jessie” 64bit
 - Ubuntu 12.04 32bit, Ubuntu 14.04 64bit
 - Centos 7 64bit
 - FreeBSD 10.2 64bit
 - OpenBSD 5.7 64bit
 - NetBSD 6.1.5 64bit
 - Darwin (OS X Yosemite)

Version 0.25.0

Compatibility notes:

- lz4 compression library (liblz4) is a new requirement (#156)
- the new compression code is very compatible: as long as you stay with zlib compression, older borg releases will still be able to read data from a repo/archive made with the new code (note: this is not the case for the default “none” compression, use “zlib,0” if you want a “no compression” mode that can be read by older borg). Also the new code is able to read repos and archives made with older borg versions (for all zlib levels 0..9).

Deprecations:

- `–compression N` (with N being a number, as in 0.24) is deprecated. We keep the `–compression 0..9` for now to not break scripts, but it is deprecated and will be removed later, so better fix your scripts now: `–compression 0` (as in 0.24) is the same as `–compression zlib,0` (now). BUT: if you do not want compression, you rather want `–compression none` (which is the default). `–compression 1` (in 0.24) is the same as `–compression zlib,1` (now) `–compression 9` (in 0.24) is the same as `–compression zlib,9` (now)

New features:

- create `–compression none` (default, means: do not compress, just pass through data “as is”). this is more efficient than zlib level 0 as used in borg 0.24)
- create `–compression lz4` (super-fast, but not very high compression)
- create `–compression zlib,N` (slower, higher compression, default for N is 6)

- create `-compression lzma,N` (slowest, highest compression, default N is 6)
- honor the `nodump` flag (`UF_NODUMP`) and do not backup such items
- list `-short` just outputs a simple list of the files/directories in an archive

Bug fixes:

- fixed `-chunker-params` parameter order confusion / malfunction, fixes #154
- close fds of segments we delete (during compaction)
- close files which fell out the lru-cache
- `fsync` `DONTNEED` now is only called for the byte range actually read, not for the whole file, fixes #158.
- fix issue with negative “all archives” size, fixes #165
- `restore_xattrs`: ignore if `setxattr` fails with `EACCES`, fixes #162

Other changes:

- remove fakeroot requirement for tests, tests run faster without fakeroot (test setup does not fail any more without fakeroot, so you can run with or without fakeroot), fixes #151 and #91.
- more tests for archiver
- `recover_segment()`: don't assume we have an fd for segment
- lru-cache refactoring / cleanup, add `dispose` function, `py.test` tests
- generalize `hashindex` code for any key length (less hardcoding)
- lock roster: catch file not found in `remove()` method and ignore it
- travis CI: use requirements file
- improved docs:
 - replace hack for `libfuse` with proper solution (install `libfuse-dev`)
 - update docs about compression
 - update development docs about fakeroot
 - internals: add some words about lock files / locking system
 - support: mention `BountySource` and for what it can be used
 - theme: use a lighter green
 - add `pypi`, `wheel`, `dist` package based install docs
 - split install docs into system-specific preparations and generic instructions

Version 0.24.0**Incompatible changes (compared to 0.23):**

- borg now always issues `-umask NNN` option when invoking another borg via `ssh` on the repository server. By that, it's making sure it uses the same `umask` for remote repos as for local ones. Because of this, you must upgrade both server and client(s) to 0.24.
- the default `umask` is `077` now (if you do not specify via `-umask`) which might be a different one as you used previously. The default `umask` avoids that you accidentally give access permissions for group and/or others to files created by borg (e.g. the repository).

Deprecations:

- “--encryption passphrase” mode is deprecated, see #85 and #97. See the new “--encryption repokey” mode for a replacement.

New features:

- `borg create --chunker-params ...` to configure the chunker, fixes #16 (attic #302, attic #300, and somehow also #41). This can be used to reduce memory usage caused by chunk management overhead, so borg does not create a huge chunks index/repo index and eats all your RAM if you back up lots of data in huge files (like VM disk images). See `docs/misc/create_chunker-params.txt` for more information.
- `borg info` now reports chunk counts in the chunk index.
- `borg create --compression 0..9` to select zlib compression level, fixes #66 (attic #295).
- `borg init --encryption repokey` (to store the encryption key into the repo), fixes #85
- improve at-end error logging, always log exceptions and set `exit_code=1`
- LoggedIO: better error checks / exceptions / exception handling
- implement `--remote-path` to allow non-default-path borg locations, #125
- implement `--umask M` and use `077` as default umask for better security, #117
- `borg check`: give a named single archive to it, fixes #139
- `cache sync`: show progress indication
- `cache sync`: reimplement the chunk index merging in C

Bug fixes:

- fix segfault that happened for unreadable files (chunker: n needs to be a signed `size_t`), #116
- fix the repair mode, #144
- repo delete: add `destroy` to allowed rpc methods, fixes issue #114
- more compatible repository locking code (based on `mkdir`), maybe fixes #92 (attic #317, attic #201).
- better Exception msg if no Borg is installed on the remote repo server, #56
- create a `RepositoryCache` implementation that can cope with >2GiB, fixes attic #326.
- fix Traceback when running `check --repair`, attic #232
- clarify help text, fixes #73.
- add help string for `--no-files-cache`, fixes #140

Other changes:

- improved docs:
 - added `docs/misc` directory for misc. writeups that won't be included “as is” into the html docs.
 - document environment variables and return codes (attic #324, attic #52)
 - web site: add related projects, fix web site url, IRC #borgbackup
 - Fedora/Fedora-based install instructions added to docs
 - Cygwin-based install instructions added to docs
 - updated AUTHORS
 - add FAQ entries about redundancy / integrity

- clarify that borg extract uses the cwd as extraction target
- update internals doc about chunker params, memory usage and compression
- added docs about development
- add some words about resource usage in general
- document how to backup a raw disk
- add note about how to run borg from virtual env
- add solutions for (ll)fuse installation problems
- document what borg check does, fixes #138
- reorganize borgbackup.github.io sidebar, prev/next at top
- deduplicate and refactor the docs / README.rst
- use borg-tmp as prefix for temporary files / directories
- short prune options without “keep-” are deprecated, do not suggest them
- improved tox configuration
- remove usage of unittest.mock, always use mock from pypi
- use entrypoints instead of scripts, for better use of the wheel format and modern installs
- add requirements.d/development.txt and modify tox.ini
- use travis-ci for testing based on Linux and (new) OS X
- use coverage.py, pytest-cov and codecov.io for test coverage support

I forgot to list some stuff already implemented in 0.23.0, here they are:

New features:

- efficient archive list from manifest, meaning a big speedup for slow repo connections and “list <repo>”, “delete <repo>”, “prune” (attic #242, attic #167)
- big speedup for chunks cache sync (esp. for slow repo connections), fixes #18
- hashindex: improve error messages

Other changes:

- explicitly specify binary mode to open binary files
- some easy micro optimizations

Version 0.23.0

Incompatible changes (compared to attic, fork related):

- changed sw name and cli command to “borg”, updated docs
- package name (and name in urls) uses “borgbackup” to have less collisions
- changed repo / cache internal magic strings from ATTIC* to BORG*, changed cache location to .cache/borg/ - this means that it currently won’t accept attic repos (see issue #21 about improving that)

Bug fixes:

- avoid defect python-msgpack releases, fixes attic #171, fixes attic #185

- fix traceback when trying to do unsupported passphrase change, fixes attic #189
- datetime does not like the year 10.000, fixes attic #139
- fix “info” all archives stats, fixes attic #183
- fix parsing with missing microseconds, fixes attic #282
- fix misleading hint the fuse ImportError handler gave, fixes attic #237
- check unpacked data from RPC for tuple type and correct length, fixes attic #127
- fix Repository._active_txn state when lock upgrade fails
- give specific path to xattr.is_enabled(), disable symlink setattr call that always fails
- fix test setup for 32bit platforms, partial fix for attic #196
- upgraded versioneer, PEP440 compliance, fixes attic #257

New features:

- less memory usage: add global option `--no-cache-files`
- check `--last N` (only check the last N archives)
- check: sort archives in reverse time order
- rename `repo::oldname newname` (rename repository)
- create `-v` output more informative
- create `--progress` (backup progress indicator)
- create `--timestamp` (utc string or reference file/dir)
- create: if “-” is given as path, read binary from stdin
- extract: if `--stdout` is given, write all extracted binary data to stdout
- extract `--sparse` (simple sparse file support)
- extra debug information for ‘fread failed’
- delete `<repo>` (deletes whole repo + local cache)
- FUSE: reflect deduplication in allocated blocks
- only allow whitelisted RPC calls in server mode
- normalize source/exclude paths before matching
- use `posix_fadvise` to not spoil the OS cache, fixes attic #252
- toplevel error handler: show tracebacks for better error analysis
- `sigusr1 / sigint` handler to print current file infos - attic PR #286
- `RPCError`: include the exception args we get from remote

Other changes:

- source: misc. cleanups, pep8, style
- docs and faq improvements, fixes, updates
- cleanup `crypto.pyx`, make it easier to adapt to other AES modes
- do `os.fsync` like recommended in the python docs
- source: Let chunker optionally work with os-level file descriptor.

- source: Linux: remove duplicate os.fsencode calls
- source: refactor `_open_rb` code a bit, so it is more consistent / regular
- source: refactor indicator (status) and item processing
- source: use `py.test` for better testing, `flake8` for code style checks
- source: fix `tox >=2.0` compatibility (test runner)
- pypi package: add python version classifiers, add FreeBSD to platforms

Attic Changelog

Here you can see the full list of changes between each Attic release until Borg forked from Attic:

Version 0.17 (bugfix release, released on X)

- Fix hashindex ARM memory alignment issue (#309)
- Improve hashindex error messages (#298)

Version 0.16 (bugfix release, released on May 16, 2015)

- Fix typo preventing the security confirmation prompt from working (#303)
- Improve handling of systems with improperly configured file system encoding (#289)
- Fix “All archives” output for attic info. (#183)
- More user friendly error message when repository key file is not found (#236)
- Fix parsing of iso 8601 timestamps with zero microseconds (#282)

Version 0.15 (bugfix release, released on Apr 15, 2015)

- `xattr`: Be less strict about unknown/unsupported platforms (#239)
- Reduce repository listing memory usage (#163).
- Fix `BrokenPipeError` for remote repositories (#233)
- Fix incorrect behavior with two character directory names (#265, #268)
- Require approval before accessing relocated/moved repository (#271)
- Require approval before accessing previously unknown unencrypted repositories (#271)
- Fix issue with hash index files larger than 2GB.
- Fix Python 3.2 compatibility issue with `noatime open()` (#164)
- Include missing `pyx` files in dist files (#168)

Version 0.14 (feature release, released on Dec 17, 2014)

- Added support for stripping leading path segments (#95) “`attic extract --strip-segments X`”
- Add workaround for old Linux systems without `acl_extended_file_no_follow` (#96)
- Add MacPorts’ path to the default `openssl` search path (#101)
- `HashIndex` improvements, eliminates unnecessary IO on low memory systems.

- Fix “Number of files” output for attic info. (#124)
- limit create file permissions so files aren’t read while restoring
- Fix issue with empty xattr values (#106)

Version 0.13 (feature release, released on Jun 29, 2014)

- Fix sporadic “Resource temporarily unavailable” when using remote repositories
- Reduce file cache memory usage (#90)
- Faster AES encryption (utilizing AES-NI when available)
- Experimental Linux, OS X and FreeBSD ACL support (#66)
- Added support for backup and restore of BSDFlags (OSX, FreeBSD) (#56)
- Fix bug where xattrs on symlinks were not correctly restored
- Added cachedir support. CACHEDIR.TAG compatible cache directories can now be excluded using `--exclude-caches` (#74)
- Fix crash on extreme mtime timestamps (year 2400+) (#81)
- Fix Python 3.2 specific lockf issue (EDEADLK)

Version 0.12 (feature release, released on April 7, 2014)

- Python 3.4 support (#62)
- Various documentation improvements a new style
- `attic mount` now supports mounting an entire repository not only individual archives (#59)
- Added option to restrict remote repository access to specific path(s): `attic serve --restrict-to-path X` (#51)
- Include “all archives” size information in “-stats” output. (#54)
- Added `--stats` option to `attic delete` and `attic prune`
- Fixed bug where `attic prune` used UTC instead of the local time zone when determining which archives to keep.
- Switch to SI units (Power of 1000 instead 1024) when printing file sizes

Version 0.11 (feature release, released on March 7, 2014)

- New “check” command for repository consistency checking (#24)
- Documentation improvements
- Fix exception during “attic create” with repeated files (#39)
- New “-exclude-from” option for `attic create/extract/verify`.
- Improved archive metadata deduplication.
- “attic verify” has been deprecated. Use “attic extract -dry-run” instead.
- “attic prune -hourly/daily...” has been deprecated. Use “attic prune -keep-hourly/daily...” instead.
- Ignore xattr errors during “extract” if not supported by the filesystem. (#46)

Version 0.10 (bugfix release, released on Jan 30, 2014)

- Fix deadlock when extracting 0 sized files from remote repositories
- “-exclude” wildcard patterns are now properly applied to the full path not just the file name part (#5).
- Make source code endianness agnostic (#1)

Version 0.9 (feature release, released on Jan 23, 2014)

- Remote repository speed and reliability improvements.
- Fix sorting of segment names to ignore NFS left over files. (#17)
- Fix incorrect display of time (#13)
- Improved error handling / reporting. (#12)
- Use fcntl() instead of flock() when locking repository/cache. (#15)
- Let ssh figure out port/user if not specified so we don't override .ssh/config (#9)
- Improved libcrypto path detection (#23).

Version 0.8.1 (bugfix release, released on Oct 4, 2013)

- Fix segmentation fault issue.

Version 0.8 (feature release, released on Oct 3, 2013)

- Fix xattr issue when backing up sshfs filesystems (#4)
- Fix issue with excessive index file size (#6)
- Support access of read only repositories.
- **New syntax to enable repository encryption:** `attic init --encryption="nonelpassphrasekeyfile"`.
- Detect and abort if repository is older than the cache.

Version 0.7 (feature release, released on Aug 5, 2013)

- Ported to FreeBSD
- Improved documentation
- Experimental: Archives mountable as fuse filesystems.
- The “user.” prefix is no longer stripped from xattrs on Linux

Version 0.6.1 (bugfix release, released on July 19, 2013)

- Fixed an issue where mtime was not always correctly restored.

Version 0.6 First public release on July 9, 2013

Internals

This page documents the internal data structures and storage mechanisms of Borg. It is partly based on [mailing list discussion about internals](#) and also on static code analysis.

Repository and Archives

Borg stores its data in a *Repository*. Each repository can hold multiple *Archives*, which represent individual backups that contain a full archive of the files specified when the backup was performed. Deduplication is performed across multiple backups, both on data and metadata, using *Chunks* created by the chunker using the *Buzhash* algorithm.

Each repository has the following file structure:

README simple text file telling that this is a Borg repository

config repository configuration

data/ directory where the actual data is stored

hints.%d hints for repository compaction

index.%d repository index

lock.roster and lock.exclusive/* used by the locking system to manage shared and exclusive locks

Lock files

Borg uses locks to get (exclusive or shared) access to the cache and the repository.

The locking system is based on creating a directory *lock.exclusive* (for exclusive locks). Inside the lock directory, there is a file indicating hostname, process id and thread id of the lock holder.

There is also a json file *lock.roster* that keeps a directory of all shared and exclusive lockers.

If the process can create the *lock.exclusive* directory for a resource, it has the lock for it. If creation fails (because the directory has already been created by some other process), lock acquisition fails.

The cache lock is usually in *~/.cache/borg/REPOID/lock.**. The repository lock is in *repository/lock.**.

In case you run into troubles with the locks, you can use the `borg break-lock` command after you first have made sure that no Borg process is running on any machine that accesses this resource. Be very careful, the cache or repository might get damaged if multiple processes use it at the same time.

Config file

Each repository has a `config` file which is an INI-style file and looks like this:

```
[repository]
version = 1
segments_per_dir = 10000
max_segment_size = 5242880
id = 57d6c1d52ce76a836b532b0e42e677dec6af9fca3673db511279358828a21ed6
```

This is where the `repository.id` is stored. It is a unique identifier for repositories. It will not change if you move the repository around so you can make a local transfer then decide to move the repository to another (even remote) location at a later time.

Keys

The key to address the key/value store is usually computed like this:

```
key = id = id_hash(unencrypted_data)
```

The `id_hash` function is:

- sha256 (no encryption keys available)
- hmac-sha256 (encryption keys available)

Segments and archives

A Borg repository is a filesystem based transactional key/value store. It makes extensive use of `msgpack` to store data and, unless otherwise noted, data is stored in `msgpack` encoded files.

Objects referenced by a key are stored inline in files (*segments*) of approx. 5MB size in numbered subdirectories of `repo/data`.

They contain:

- header size
- crc
- size
- tag
- key
- data

Segments are built locally, and then uploaded. Those files are strictly append-only and modified only once.

Tag is either `PUT`, `DELETE`, or `COMMIT`. A segment file is basically a transaction log where each repository operation is appended to the file. So if an object is written to the repository a `PUT` tag is written to the file followed by the object id and data. If an object is deleted a `DELETE` tag is appended followed by the object id. A `COMMIT` tag is written when a repository transaction is committed. When a repository is opened any `PUT` or `DELETE` operations not followed by a `COMMIT` tag are discarded since they are part of a partial/uncommitted transaction.

The manifest

The manifest is an object with an all-zero key that references all the archives. It contains:

- version
- list of archive infos
- timestamp
- config

Each archive info contains:

- name
- id
- time

It is the last object stored, in the last segment, and is replaced each time.

The Archive

The archive metadata does not contain the file items directly. Only references to other objects that contain that data. An archive is an object that contains:

- version

- name
- list of chunks containing item metadata
- cmdline
- hostname
- username
- time

The Item

Each item represents a file, directory or other fs item and is stored as an `item` dictionary that contains:

- path
- list of data chunks
- user
- group
- uid
- gid
- mode (item type + permissions)
- source (for links)
- rdev (for devices)
- mtime, atime, ctime in nanoseconds
- xattrs
- acl
- bsdfiles

All items are serialized using `msgpack` and the resulting byte stream is fed into the same chunker algorithm as used for regular file data and turned into deduplicated chunks. The reference to these chunks is then added to the archive metadata. To achieve a finer granularity on this metadata stream, we use different chunker params for this chunker, which result in smaller chunks.

A chunk is stored as an object as well, of course.

Chunks

The Borg chunker uses a rolling hash computed by the [Buzhash](#) algorithm. It triggers (chunks) when the last `HASH_MASK_BITS` bits of the hash are zero, producing chunks of $2^{\text{HASH_MASK_BITS}}$ Bytes on average.

`borg create --chunker-params CHUNK_MIN_EXP,CHUNK_MAX_EXP,HASH_MASK_BITS,HASH_WINDOW_SIZE` can be used to tune the chunker parameters, the default is:

- `CHUNK_MIN_EXP = 19` (minimum chunk size = 2^{19} B = 512 kiB)
- `CHUNK_MAX_EXP = 23` (maximum chunk size = 2^{23} B = 8 MiB)
- `HASH_MASK_BITS = 21` (statistical medium chunk size $\approx 2^{21}$ B = 2 MiB)
- `HASH_WINDOW_SIZE = 4095 [B] (0xFFF)`

The buzhash table is altered by XORing it with a seed randomly generated once for the archive, and stored encrypted in the keyfile. This is to prevent chunk size based fingerprinting attacks on your encrypted repo contents (to guess what files you have based on a specific set of chunk sizes).

For some more general usage hints see also `--chunker-params`.

Indexes / Caches

The **files cache** is stored in `cache/files` and is indexed on the `file path hash`. At backup time, it is used to quickly determine whether we need to chunk a given file (or whether it is unchanged and we already have all its pieces). It contains:

- age
- file inode number
- file size
- file `mtime_ns`
- file content chunk hashes

The inode number is stored to make sure we distinguish between different files, as a single path may not be unique across different archives in different setups.

The files cache is stored as a python associative array storing python objects, which generates a lot of overhead.

The **chunks cache** is stored in `cache/chunks` and is indexed on the `chunk id_hash`. It is used to determine whether we already have a specific chunk, to count references to it and also for statistics. It contains:

- reference count
- size
- encrypted/compressed size

The **repository index** is stored in `repo/index.%d` and is indexed on the `chunk id_hash`. It is used to determine a chunk's location in the repository. It contains:

- segment (that contains the chunk)
- offset (where the chunk is located in the segment)

The repository index file is random access.

Hints are stored in a file (`repo/hints.%d`). It contains:

- version
- list of segments
- compact

hints and index can be recreated if damaged or lost using `check --repair`.

The chunks cache and the repository index are stored as hash tables, with only one slot per bucket, but that spreads the collisions to the following buckets. As a consequence the hash is just a start position for a linear search, and if the element is not in the table the index is linearly crossed until an empty bucket is found.

When the hash table is filled to 75%, its size is grown. When it's emptied to 25%, its size is shrunk. So operations on it have a variable complexity between constant and linear with low factor, and memory overhead varies between 33% and 300%.

Indexes / Caches memory usage

Here is the estimated memory usage of Borg:

```
chunk_count ~= total_file_size / 2 ^ HASH_MASK_BITS
repo_index_usage = chunk_count * 40
chunks_cache_usage = chunk_count * 44
files_cache_usage = total_file_count * 240 + chunk_count * 80
mem_usage ~= repo_index_usage + chunks_cache_usage + files_cache_usage = chunk_count * 164
+ total_file_count * 240
```

All units are Bytes.

It is assuming every chunk is referenced exactly once (if you have a lot of duplicate chunks, you will have less chunks than estimated above).

It is also assuming that typical chunk size is $2^{\text{HASH_MASK_BITS}}$ (if you have a lot of files smaller than this statistical medium chunk size, you will have more chunks than estimated above, because 1 file is at least 1 chunk).

If a remote repository is used the repo index will be allocated on the remote side.

E.g. backing up a total count of 1 Mi (IEC binary prefix e.g. 2^{20}) files with a total size of 1TiB.

1. with `create --chunker-params 10,23,16,4095` (custom, like borg < 1.0 or attic):
`mem_usage = 2.8GiB`
2. with `create --chunker-params 19,23,21,4095` (default):
`mem_usage = 0.31GiB`

Note: There is also the `--no-files-cache` option to switch off the files cache. You'll save some memory, but it will need to read / chunk all the files as it can not skip unmodified files then.

Encryption

AES-256 is used in CTR mode (so no need for padding). A 64bit initialization vector is used, a **HMAC-SHA256** is computed on the encrypted chunk with a random 64bit nonce and both are stored in the chunk. The header of each chunk is: TYPE (1) + HMAC (32) + NONCE (8) + CIPHERTEXT. Encryption and HMAC use two different keys.

In AES CTR mode you can think of the IV as the start value for the counter. The counter itself is incremented by one after each 16 byte block. The IV/counter is not required to be random but it must NEVER be reused. So to accomplish this Borg initializes the encryption counter to be higher than any previously used counter value before encrypting new data.

To reduce payload size, only 8 bytes of the 16 bytes nonce is saved in the payload, the first 8 bytes are always zeros. This does not affect security but limits the maximum repository capacity to only 295 exabytes ($2^{64} * 16$ bytes).

Encryption keys (and other secrets) are kept either in a key file on the client ('keyfile' mode) or in the repository config on the server ('repokey' mode). In both cases, the secrets are generated from random and then encrypted by a key derived from your passphrase (this happens on the client before the key is stored into the keyfile or as repokey).

The passphrase is passed through the `BORG_PASSPHRASE` environment variable or prompted for interactive usage.

Key files

When initialized with the `init -e keyfile` command, Borg needs an associated file in `$HOME/.config/borg/keys` to read and write the repository. The format is based on `msgpack`, base64 encoding and `PBKDF2` SHA256 hashing, which is then encoded again in a `msgpack`.

The internal data structure is as follows:

version currently always an integer, 1

repository_id the `id` field in the `config` INI file of the repository.

enc_key the key used to encrypt data with AES (256 bits)

enc_hmac_key the key used to HMAC the encrypted data (256 bits)

id_key the key used to HMAC the plaintext chunk data to compute the chunk's id

chunk_seed the seed for the `buzhash` chunking table (signed 32 bit integer)

Those fields are processed using `msgpack`. The utf-8 encoded passphrase is processed with `PBKDF2` (SHA256, 100000 iterations, random 256 bit salt) to give us a derived key. The derived key is 256 bits long. A `HMAC-SHA256` checksum of the above fields is generated with the derived key, then the derived key is also used to encrypt the above pack of fields. Then the result is stored in a another `msgpack` formatted as follows:

version currently always an integer, 1

salt random 256 bits salt used to process the passphrase

iterations number of iterations used to process the passphrase (currently 100000)

algorithm the hashing algorithm used to process the passphrase and do the HMAC checksum (currently the string `sha256`)

hash the HMAC of the encrypted derived key

data the derived key, encrypted with AES over a `PBKDF2` SHA256 key described above

The resulting `msgpack` is then encoded using base64 and written to the key file, wrapped using the standard `textwrap` module with a header. The header is a single line with a MAGIC string, a space and a hexadecimal representation of the repository id.

Compression

Borg supports the following compression methods:

- none (no compression, pass through data 1:1)
- lz4 (low compression, but super fast)
- zlib (level 0-9, level 0 is no compression [but still adding zlib overhead], level 1 is low, level 9 is high compression)
- lzma (level 0-9, level 0 is low, level 9 is high compression).

Speed: none > lz4 > zlib > lzma Compression: lzma > zlib > lz4 > none

Be careful, higher zlib and especially lzma compression levels might take a lot of resources (CPU and memory).

The overall speed of course also depends on the speed of your target storage. If that is slow, using a higher compression level might yield better overall performance. You need to experiment a bit. Maybe just watch your CPU load, if that is relatively low, increase compression until 1 core is 70-100% loaded.

Even if your target storage is rather fast, you might see interesting effects: while doing no compression at all (`none`) is a operation that takes no time, it likely will need to store more data to the storage compared to using `lz4`. The time needed to transfer and store the additional data might be much more than if you had used `lz4` (which is super fast, but still might compress your data about 2:1). This is assuming your data is compressible (if you backup already compressed data, trying to compress them at backup time is usually pointless).

Compression is applied after deduplication, thus using different compression methods in one repo does not influence deduplication.

See `borg create --help` about how to specify the compression level and its default.

Development

This chapter will get you started with Borg development.

Borg is written in Python (with a little bit of Cython and C for the performance critical parts).

Style guide

We generally follow [pep8](#), with 120 columns instead of 79. We do *not* use form-feed (`^L`) characters to separate sections either. Compliance is tested automatically when you run the tests.

Output and Logging

When writing logger calls, always use correct log level (`debug` only for debugging, `info` for informative messages, `warning` for warnings, `error` for errors, `critical` for critical errors/states).

When directly talking to the user (e.g. Y/N questions), do not use logging, but directly output to `stderr` (not: `stdout`, it could be connected to a pipe).

To control the amount and kinds of messages output to `stderr` or emitted at `info` level, use flags like `--stats` or `--list`.

Building a development environment

First, just install `borg` into a virtual env as described before.

To install some additional packages needed for running the tests, activate your virtual env and run:

```
pip install -r requirements.d/development.txt
```

Running the tests

The tests are in the `borg/testsuite` package.

To run all the tests, you need to have `fakeroot` installed. If you do not have `fakeroot`, you still will be able to run most tests, just leave away the `fakeroot -u` from the given command lines.

To run the test suite use the following command:

```
fakeroot -u tox # run all tests
```

Some more advanced examples:

```
# verify a changed tox.ini (run this after any change to tox.ini):
fakeroot -u tox --recreate

fakeroot -u tox -e py34 # run all tests, but only on python 3.4

fakeroot -u tox borg.testsuite.locking # only run 1 test module

fakeroot -u tox borg.testsuite.locking -- -k '"not Timer"' # exclude some tests

fakeroot -u tox borg.testsuite -- -v # verbose py.test
```

Important notes:

- When using `--` to give options to `py.test`, you **MUST** also give `borg.testsuite[.module]`.

Regenerate usage files

Usage and API documentation is currently committed directly to git, although those files are generated automatically from the source tree.

When a new module is added, the `docs/api.rst` file needs to be regenerated:

```
./setup.py build_api
```

When a command is added, a commandline flag changed, added or removed, the usage docs need to be rebuilt as well:

```
./setup.py build_usage
```

Building the docs with Sphinx

The documentation (in reStructuredText format, `.rst`) is in `docs/`.

To build the html version of it, you need to have sphinx installed:

```
pip3 install sphinx # important: this will install sphinx with Python 3
```

Now run:

```
cd docs/
make html
```

Then point a web browser at `docs/_build/html/index.html`.

The website is updated automatically through Github web hooks on the main repository.

Using Vagrant

We use Vagrant for the automated creation of testing environments and borgbackup standalone binaries for various platforms.

For better security, there is no automatic sync in the VM to host direction. The plugin `vagrant-scp` is useful to copy stuff from the VMs to the host.

Usage:

```
# To create and provision the VM:
vagrant up OS
# To create an ssh session to the VM:
vagrant ssh OS command
# To shut down the VM:
vagrant halt OS
# To shut down and destroy the VM:
vagrant destroy OS
# To copy files from the VM (in this case, the generated binary):
vagrant scp OS:/vagrant/borg/borg.exe .
```

Creating standalone binaries

Make sure you have everything built and installed (including llfuse and fuse). When using the Vagrant VMs, pyinstaller will already be installed.

With virtual env activated:

```
pip install pyinstaller # or git checkout master
pyinstaller -F -n borg-PLATFORM borg/__main__.py
for file in dist/borg-*; do gpg --armor --detach-sign $file; done
```

If you encounter issues, see also our *Vagrantfile* for details.

Note: Standalone binaries built with pyinstaller are supposed to work on same OS, same architecture (x86 32bit, amd64 64bit) without external dependencies.

Creating a new release

Checklist:

- make sure all issues for this milestone are closed or moved to the next milestone
- find and fix any low hanging fruit left on the issue tracker
- check that Travis CI is happy
- update `CHANGES.rst`, based on `git log $PREVIOUS_RELEASE..`
- check version number of upcoming release in `CHANGES.rst`
- verify that `MANIFEST.in` and `setup.py` are complete
- `python setup.py build_api ; python setup.py build_usage` and commit
- tag the release:

```
git tag -s -m "tagged/signed release X.Y.Z" X.Y.Z
```

- run tox and/or binary builds on all supported platforms via vagrant, check for test failures
- create a release on PyPi:

```
python setup.py register sdist upload --identity="Thomas Waldmann" --sign
```

- close release milestone on Github
- announce on:

- Mailing list
- Twitter (follow @ThomasJWaldmann for these tweets)
- IRC channel (change /topic)
- create a Github release, include:
 - standalone binaries (see above for how to create them)
 - * for OS X, document the OS X Fuse version in the README of the binaries. OS X FUSE uses a kernel extension that needs to be compatible with the code contained in the binary.
 - a link to `CHANGES.rst`

Borg Contributors (“The Borg Collective”)

- Thomas Waldmann <tw@waldmann-edv.de>
- Antoine Beaupré <anarcat@debian.org>
- Radek Podgorny <radek@podgorny.cz>
- Yuri D’Elia
- Michael Hanselmann <public@hansmi.ch>
- Teemu Toivanen <public@profnetti.fi>

Borg is a fork of Attic.

Attic authors

Attic is written and maintained by Jonas Borgström and various contributors:

Attic Development Lead

- Jonas Borgström <jonas@borgstrom.se>

Attic Patches and Suggestions

- Brian Johnson
- Cyril Roussillon
- Dan Christensen
- Jeremy Maitin-Shepard
- Johann Klähn
- Petros Moisiadis
- Thomas Waldmann
